Goteborg Univ. (Sweden). Dept. of Oceanography.
A. Stigebrandt.
Nordic Hydrology, Vol 9, No 3/4, p 219-244, 1978. 10 fig, 3 tab, 15 ref, 5 append.

Descriptors: *Lakes, *Ice cover, *Dynamics, Flow, Temperature, Water temperature, Circulation, Mixing, Heat transfer, Discharge(Water), Withdrawal, Theoretical analysis, Model studies, On-site investigations, Limnology, Water circulation, *Sweden.

The dynamics of different regimes in an ice covered inland lake with through-flow were discussed. A new theory for selective withdrawa was tested with success. The mixing of the entering river with lake water was estimated, and it was found that the net volume flux increases about 60% through the mixing. The flow in the main part of the lake was discussed, and some measurements were presented (Sims-ISWS)

THE EFFECT OF COMPETITION AND SALINITY ON THE GROWTH OF A SALT MARSH PLANT SPECIES,
California Univ., Davis. Dept. of Botany.
M. G. Barbour.
Oecologia, Vol. 37, p 93-99, 1978. 1 fig, 3 tab, 12 ref.

Descriptors: *Plant growth, *Salinity, *Salt marshes, *Competition, Rhizomes, Salt tolerance, Perennial ryegrass, Habitats, Plant growth regulators, Plant physiology, Ecology, Halophytes, *Jaumean.

Young rhizome sprouts of the herbaceous perennial Jaumea carnosa were propagated from material collected in a salt marsh along the central California coast. The sprouts were transplanted to flats of sand sown with different densities of seeds of a representative glycophyte, Lolium perenne. In the monospecific control flats, the growth of both species declined with increasing salinity, but the relative decline of Lolium was three times that of Jaumea. Both species grew well when subirrigated by 400 ppm salt water, but grew poorly when subirrigated by 11,600 ppm salt water, indicating that aeration alone is not the most significant factor in the marsh. The effect of interspecific competition on Jaumea was marked at low salinity, depressing growth by 52% compared to controls, but at high salinity the competitive effect was insignificant, whether the plants were watered from above or subirrigated. This supports the hypothesis that intolerant halophytes such as Jaumea are restricted in nature to salt marshes because they are poor competitors with glocophytes on non-saline soils. (EIS-Deal)

IMPORTANCE OF RIPARIAN ECOSYSTEMS: BIOTIC CONSIDERATIONS,
New Mexico Dept. of Game and Fish, Santa Fe.
J. P. Hubbard.
In: Importance, Preservation and Management of Riparian Habitat: A Symposium, July 9, 1977, Tuscon, Arizona, USDA Forest Service General Technical Report RM-43, p. 14-18. 1 tab, 18 ref.

Descriptors: *Riparian land, *Wildlife, *Habitats, Fish, Birds, Amphibians, Mammals, Southwest U.S., Wetlands, Ecosystems.

Riparian Ecosystems are of importance in maintaining the large degree of biotic diversity of the southwestern United States. Such habitats are of paramount importance in the survival of native fishes. Amphibians are seasonally dependent on riparian habitats. A number of bird species are dependent on riparian ecosystems; some mammal species also show this dependence. (Stihler-Mass)

VEGETATION STRUCTURE AND BIRD USE IN THE LOWER COLORADO RIVER VALLEY,
Arizona State Univ., Tempe. Dept. of Zoology; and Arizona State Univ., Tempe. Center for Environmental Studies.
B. W. Anderson, and R. D. Ohmart.
In: Importance, Preservation and Management of Riparian Habitat: A Symposium, July 9, 1977, Tuscon, Arizona, USDA Forest Service General Technical Report RM-43, p. 23-34. 1 fig, 6 tab, 27 ref.

Descriptors: *Riparian land, *Birds, *Habitats, Structure, Seasonal, Habitat breadths, *Colorado River Valley.

Correlations between bird population parameters and vegetation structure characteristics were found to vary seasonally. Mean habitat breadth of all species is narrowest with respect to vegetative structure in winter and broadest in summer; permanent residents occupy the structural types more evenly than visitors. Habitat breadth of various species is greater in summer than in winter. Narrow habitat breadths are accompanied by reduced habitat overlap among the species in winter, suggesting that winter is potentially the time of greatest stress. Permanent residents tend to be less specialized with respect to structure than visitors. (Stihler-Mass)

REGENERATION AND DISTRIBUTION OF SYCAMORE AND COTTONWOOD TREES ALONG SONOITA CREEK, SANTA CRUZ COUNTY, ARIZONA,
Arizona State Univ., Tempe. Dept. of Zoology.
R. L. Glinski.
In: Importance, Preservation and Management of Riparian Habitat: A Symposium, July 9, 1977, Tucson, Arizona, USDA Forest Service General Technical Report RM-43, p. 116-123. 2 fig, 1 tab, 9 ref.

Descriptors: *Riparian plants, *Riparian land, *Trees, *Sycamore trees, *Cottonwoods, Arizona, Streams, Grazing, Habitats, Erosion, Wetlands, Southwest U.S., Reproduction.

Sycamores reproduced from root and trunk sprouts and because of this their distribution is not as likely to change significantly. Cottonwood reproduction was nearly absent in areas grazed by cattle, and was confined to the narrow erosion channel. If this regeneration pattern continues, the future maximum width of the cottonwood forest will decrease nearly 60%. (Stihler-Mass)

INFLUENCES OF RIPARIAN VEGETATION ON AQUATIC ECOSYSTEMS WITH PARTICULAR REFERENCE TO SALMONID FISHES AND THEIR FOOD SUPPLY,
Pacific Northwest Forest and Range Experiment Station, Corvallis, OR. Forestry Sciences Lab.
W. R. Meehan, F. J. Swanson, and J. R. Sedell.
In: Importance, Preservation and Management of Riparian Habitat: A Symposium, July 9, 1977, Tuscon, Arizona, USDA Forest Service General Technical Report RM-43, p. 137-145. 4 fig, 26 ref.

Descriptors: *Riparian land, *Salmonids, *Habitats, *Effects, *Riparian plants, Streams, Wetlands, Time, Temperature, Sediments, Vegetation, Grazing, Insects, Fish, Southwest U.S.

The riparian zone has important influences on the total stream ecosystem including the habitat of salmonids. Shade and organic detritus from the riparian zone control the food base of the stream and large woody debris influences channel morphology. The effectiveness of a riparian zone in regulating input of light, dissolved nutrients and litterfall to the stream varies through time following wildfire, clearcutting or other disturbances. The influence and role of riparian vegetation will vary with stream order and position along the continuum from headwaters to mouth. Riparian zones are affected by livestock grazing, logging, and road construction. (Stihler-Mass)

THE IMPORTANCE OF RIPARIAN HABITAT TO MIGRATING BIRDS,
Museum of Northern Arizona, Inc., Flagstaff.
L. E. Stevens, B. T. Brown, J. M. Simpson, and R. R. Johnson.
In: Importance, Preservation and Management of

Group 2I—Water In Plants

Riparian Habitat: A Symposium, July 9, 1977, Tuscon, Arizona, USDA Forest Service General Technical Report RM-43, p. 156-164. 2 fig, 4 tab, 24 ref.

Descriptors: *Migratory birds, *Riparian land, *Southwest U.S., *Ecological distribution, Ecology, Birds, Wildlife, *Riparian plants, Vegetation, Habitats, Wetlands, Streams, Rivers.

Seven pairs of study sites in riparian and adjacent, nonriparian habitats were censused for spring migrant passerines. Riparian plots contained up to 10.6 times the number of migrants per hectare found on adjacent, nonriparian plots. Stop-over habitat selection is indicated by differing migrant densities and species diversities in various habitats. Insectiverous migrants generally preferred riparian habitats. Granivores displayed habitat selection by avoiding dense riparian forests and woodland situations and concentrated in adjacent shrublands and open riparian forests. (Stihler-Mass)

SIGNIFICANCE OF RIO GRANDE RIPARIAN SYSTEMS UPON THE AVIFAUNA,
National Park Service, Santa Fe, NM. Southwest Region.
R. H. Wauer.
In: Importance, Preservation and Management of Riparian Habitat: A Symposium, July 9, 1977, Tuscon, Arizona, USDA Forest Service General Technical Report RM-43, p. 165-174. 1 tab, 24 ref.

Descriptors: *Rio Grande River, *Riparian land, *Birds, Habitats, Riparian plants, Vegetation, Wildlife, Wetlands, Rivers, *Texas, Migratory birds, Southwest U.S.

The Rio Grande corridor in West Texas serves as a significant migratory and emigration route for avifauna, and 38 species are known to meet within the riparian habitat. A total of 94 species are known to breed within riparian systems within the American Southwest. The Rio Grande area provides suitable habitat for 40% of those. Nine species--great blue and green herons, peregrine falcon, American kestrel, white-winged dove, screech owl, Bell's vireo, yellow warbler, and bronzed cowbird--are discussed as indicators of changes within the system and the importance of the Rio Grande area as a refugium. (Stihler-Mass)

POPULATION FLUCTUATIONS IN NOCTURNAL RODENTS IN THE LOWER COLORADO RIVER VALLEY,
Arizona State Univ., Tempe. Dept. of Zoology; and Arizona State Univ., Tempe. Center for Environmental Studies.
B. W. Anderson, J. Drake, and R. D. Ohmart.
In: Importance, Preservation and Management of Riparian Habitat: A Symposium, July 9, 1977, Tuscon, Arizona, USDA Forest Service General Technical Report RM-43, p. 183-192. 9 fig, 2 tab, 8 ref.

Descriptors: *Colorado River, *Mammals, *Rodents, *Cycles, Seasonal, Riparian land, Vegetation, Willow trees, Mesquite, Rivers, Wetlands, Southwest U.S., Wildlife.

An examination of population fluctuations in a sample of over 10,000 rodents comprising five species collected along the lower Colorado River revealed distinct seasonal (annual) cycles in Perognathus penicillatus and Dipodomys merriami. Overall rodent populations were decreasing for the 3.5 year period for which data are presented. This was most pronounced in Peromyscus eremicus. Although these populations were declining, there was significant intraspecific asynchrony among the populations in different vegetation types. There was also a significant degree of interspecific asynchrony in population fluctuations which renders the task of evaluating habitat difficult and subject to error unless carried out for several years in various vegetation types. (Stihler-Mass)

TERRESTRIAL MAMMALS OF THE RIPARIAN CORRIDOR IN BIG BEND NATIONAL PARK,
Texas A and M Univ., College Station Dept. of Wildlife and Fisheries Sciences.
W. J. Boeer, and D. J. Schmidly.
In: Importance, Preservation & Management of Riparian Habitat: A Symposium, July 9, 1977, Tucson, Arizona USDA Forest Service General Technical Report RM-43, p. 212-217. 2 tab, 15 ref.

Descriptors: *Riparian land, *Mammals, *Southwest U.S., *Rodents, *Rio Grande River, Wildlife, Vegetation, Trees, Cottonwoods, Willow trees, Habitats, Wetlands, Streams, Rivers, Grazing, Livestock, *Big Bend National Park, Saltcedar, *Texas.

Thirty species of terrestrial mammals inhabit riparian habitats in Big Bend National Park (BBNP) but only one species (the beaver, Castor canadensis) is restricted to those areas. Major changes in vegetation during the past 30 years, involving an increase in basal and canopy cover, have resulted in the elimination of at least one species (Ord's kangaroo rat, Dipodomys ordii) from the river corridor as well as increased abundance and distribution of two other species (Hispid cotton rat, Sigmodon hispidus and white-footed mouse, Peromyscus leucopus). Compared to other major plant communities in BBNP, the rodent fauna of the riparian community has lower evenness, richness, and diversity indices. Human use and trespass livestock grazing are the major impact acting upon the natural riparian communities in BBNP today. (Stihler-Mass)

SPECIALIZED HABITAT REQUIREMENTS OF BIRDS: SNAG MANAGEMENT, OLD GROWTH, AND RIPARIAN HABITAT,
Pacific Northwest Forest and Range Experiment Station, La Grande, OR
E. L. Bull.
In: Workshop on Nongame Bird Habitat Management in Coniferous Forests of the Western United States, Portland, Oregon, February 7-9, 1977. p 74-82. 2 fig, 6 tab, 25 ref.

Descriptors: *Wildlife habitat, Non-game birds, *Riparian land, Habitats, Birds, Wildlife, Songbirds, Wildlife management, Wetlands, Forests.

The values, roles, and management of snags, old-growth forests, and riparian zones, are discussed as they relate to birds in forest ecosystems. Riparian habitat is an extremely critical and unique type. Riparian makes up the smallest percentage in land area of the habitat types, yet it is the most important habitat to wildlife whether it is in the Coast Ranges or on the desert. A diversity of birdlife is possible because of the diversity of habitat components with riparian zones. This diversity enhances the richness and stability of the ecosystem over time and space. (Steiner-Mass)
W79-03731

ECOLOGICAL DISTRIBUTION OF BREEDING WATERFOWL POPULATIONS IN NORTH DAKOTA.
Fish and Wildlife Service, Jamestown, ND. Northern Prairie Wildlife Research Center.
R. E. Stewart, and H. A. Kantrud.
Journal of Wildlife Management, Vol. 37, No. 1, p 39-50, January, 1973. 2 fig, 6 tab, 12 ref.

Descriptors: *Grasslands, *Potholes, *Wetlands, *Ecological distribution, *Waterfowl, Wildlife, Freshwater marshes, Ecology, Water levels, Ponds, Marshes, *North Dakota, Habitats, Animal populations.

The total wetland acreage in North Dakota was estimated as about 3.2 million acres. Natural basin wetland varied from a low of about 4% of total wetland acreage in the Southwestern Slope Region to a high of 93% in the Prairie Pothole Region, where about 84% of the statewide duck population occurred. Within the Prairie Pothole Region seasonal (Class III) ponds comprised 36 and 23%, respectively, of the total acreage and number of wetlands, and semipermanent (Class IV) ponds and lakes comprised 18 and 3%, respectively, of these totals. Agriculture has had drastic effects on wetlands in this region. In the Prairie Pothole Region, seasonal ponds and semipermanent ponds and lakes were utilized by about 48 and 27%, respectively, of the total breeding ducks. Optimum environmental conditions for breeding dabbling ducks were present during years when large numbers and acreages of seasonal (Class III) pond basins contained surface water. Semipermanent (Class IV) ponds and lakes were the principal habitats for breeding diving ducks, and were also important to dabbling ducks, particularly during dry years. (Howard-Mass)
W79-03732

THE LIFE HISTORY OF SHOOTS OF CAREX LACUSTRIS,
Ithaca Coll., NY. Dept. of Biology.
J M Bernard
Canadian Journal of Botany, Vol. 53, No. 3, p. 256-260, February 1, 1975. 5 fig, 1 tab, 10 ref.

Descriptors: *Freshwater marshes, *Rooted aquatic plants, *Life history studies, Wetlands, Marshes, Plant growth, Period of growth, *Sedges, *New York.

Most shoots of Carex lacustris live for about 12 to 14 months, emerging in autumn overwintering as shoots of up to 50 cm in length, and maturing during the next summer. Others emerge in early spring but both groups die in late autumn. A third class emerges in late July or August, grow to be over 50 cm in length, and die in late autumn living only 2 or 3 months. Flower initials in this species begin growth in the September to October period and overwinter while about 1.0 cm in length. The shoots that develop inflorescences are in general longer, heavier, and have a greater basal diameter than those shoots which do not flower. More shoots flower if the water level in the marsh was high the previous year. (Howard-Mass)
W79-03733

SEASONAL CHANGES IN THE STANDING CROP OF TWO MONTANE SEDGES,
Minnesota Univ., Minneapolis Dept. of Botany
E. Gorham, and M. G. Somers
Canadian Journal of Botany, Vol. 51, No. 6, p 1097-1108, June, 1973. 13 fig, 1 tab, 8 ref.

Descriptors: *Wetlands, *Standing crops, *Rooted aquatic plants, *Productivity, *Rocky Mountain Region, Canada, Biomass, Ecology, *Seasonal, Life history studies, Sedges.

Aboveground green biomass of a montane pure stand of Carex rostrata varies from about 125 g sq

m (air-dry weight) at the end of November to about 640 g/sq m in early August. The maximum production rate of about 6 g/sq m per day occurs in May. For a nearby stand of Carex aquatilis with a prominent moss layer the aboveground green biomass of sedge material varies from about 40 g/sq m in February to about 380 g/sq m in mid-August. The maximum production rate for sedge material is about 4 g/sq m per day in July. Both species exhibit two main populations of shoots, one emerging in late summer and the other through winter and early spring. The winter and spring shoots of Carex rostrata flower and die after about 18 months, while the late summer shoots, which do not mature vegetatively until the following summer, have a life-span of about 2 years. The late summer shoots of Carex aquatilis mature vegetatively before winter, and flower and die within about 12 months; while the winter and spring shoots live through the next winter, and flower and die the following summer after a life-span of about 18 months. (Howard-Mass)
W79-03734

VEGETATION CHANGES IN SHALLOW MARSH WETLANDS UNDER IMPROVING MOISTURE REGIME,
Canadian Wildlife Service, Saskatoon (Saskatchewan).
J. B. Miller.
Canadian Journal of Botany, Vol. 51, No. 8, p 1443-1457, August, 1973. 1 fig, 8 tab, 21 ref.

Descriptors: *Freshwater marshes, *Potholes, *Succession, *Moisture, *Rooted aquatic plants, *Submerged plants, Wetlands, Flooding, Marsh management, Canada, Vegetation establishment, Ecology, Ecological distribution.

Decreases in density of shallow marsh emergents in wetlands of the grassland and parkland regions of Saskatchewan occurred with greater than normal water depth at the start of the growing season. Two or more years of continuous flooding or repeated autumn reflooding were required to eliminate emergent cover completely. Changes in species composition occurred when basins were grazed and as vegetation reestablished after cultivation, but no change followed mowing or burning. Certain plants were designated 'disturbance' species on the basis of their response to soil exposure. Species composition of rooted submergents in a wetland can be used as a indicator of its moisture regime. Shallow marsh wetlands in basins of 1 ac (0.41 ha) or has experienced little year-long flooding and converted to open water only under atypical conditions. Larger wetlands required basin depths to excess of 36 in (96.4 cm) to have any amount of year-long flooding and to convert to open water. These basin size and depth criteria have applications in habitat evaluations by waterfowl managers. (Howard-Mass)
W79-03735

ROOT PRODUCTION AND ROOT TURNOVER IN A WET TUNDRA ECOSYSTEM, BARROW, ALASKA,
Duke Univ., Durham. Dept. of Botany.
G. R. Shaver, and W. D. Billings.
Ecology, Vol. 56, No. 2, p. 401-409, Early Spring, 1975. 8 fig, 4 tab, 22 ref.

Descriptors: *Tundra, *Root systems, *Rooted aquatic plants, *Biomass, *Turnovers, Plant growth, Wetlands, Productivity, Soil temperature, *Alaska, Ecology, Graminoids, Sedges.

Production of new roots by three species of graminoids in the wet tundra near Barrow, Alaska, was found to be strongly correlated with age of individual tillers, each species having a distinctive growth pattern and phenology. Root turnover rates also varied considerably with a range from an annual turnover to 6 to 8 (10) years. An estimate of root turnover on an ecosystem basis is about 100 g/sq m per year, or 25% of the live root biomass. Species with the shallowest and longest lived roots have the greatest weight per unit length of root, and vice versa. Each species has a characteristic root distribution pattern with depth and in relation to the progress of soil thaw. (Howard-Mass)
W79-03736

PRIMARY PRODUCTION AND LIFE HISTORY OF CAREX LACUSTRIS,
Ithaca Coll., NY. Dept. of Biology.
J. M. Bernard, and J. G. MacDonald, Jr.
Canadian Journal of Botany, Vol. 52, No. 1, p. 117-123, January, 1974. 7 fig, 1 tab, 17 ref.

Descriptors: *Freshwater marshes, *Rooted aquatic plants, *Productivity, *Standing crops, *Life history studies, Ecology, Marshes, Wetlands, Roots, *New York, Sedges.

In a Carex lacustris wetland, seasonal aboveground standing crops of 180 g/sq m in winter and 1037 g/sq m maximum in summer were determined. Seasonal aboveground production was estimated at 857 g/sq m per year with a maximum daily production of 15 g/sq m. A second estimate taking into account the high shoot mortality during the growing season provided values of 1580 g/sq m per year for seasonal aboveground production and 20.3 g/sq m for maximum daily production. Belowground standing crop was 387 g/sq m in winter and declined to an average summer low of 226 g/sq m. Belowground standing crop increased during autumn and, by October 7, a value equal to the previous winter's value was reached. Shoots of Carex lacustris live for one year or less, emerging in autumn, overwintering, and then dying during the next summer. (Howard-Mass)
W79-03737

COMPARATIVE GROWTH AND FOLIAR ELEMENT CONCENTRATIONS OF LARIX LARICINA OVER A RANGE OF WETLAND TYPES IN MINNESOTA,
Minnesota Univ., St. Paul. Dept. of Botany.
D. L. Tilton.
Journal of Ecology, Vol 66, No 2, p 499-512, July, 1978. 3 fig, 7 tab, 44 ref.

Descriptors: *Wetlands, *Deciduous trees, *Plant growth, *Nutrients, *Soil-water-plant relationships, Fertility, Soil properties, Soil moisture, Soil types, Freshwater marshes, Marshes, Swamps, Bogs, Fen, *Minnesota, Nitrogen, Phosphorus, Magnesium, Manganese, Calcium.

Needle and lateral shoot length, stemwood radial increment and site index of Larix laricuna in Minnesota were lower in acid, nutrient-poor bogs than in circum-neutral, relatively nutrient-rich fens. Variation in these growth measures was positively correlated with foliar concentrations of N and, to a lesser extent, P. Nitrogen and P concentrations in the foliage were positively correlated with specific conductivity of the soil water at a site, and inversely correlated with site wetness. Foliar concentrations of Ca were also positively correlated with specific conductivity, while Mg concentrations in the foliage were positively correlated with soil water pH and specific conductivity. Manganese concentrations were inversely related to soil water pH. (Howard-Mass)
W79-03739

MORTALITY AND INITIAL PROPAGULE SIZE IN MANGROVE SEEDLINGS IN PANAMA,
Chicago Univ., IL. Dept. of Biophysics and Theoretical Biology.
D. Rabinowitz.
Journal of Ecology, Vol. 66, No 1, p 45-51, March, 1978. 3 fig, 2 tab, 17 ref

Descriptors: *Mangrove swamp, *Reproduction, *Mortality, *Size, Wetlands, Swamps, Brackish water, Longevity, Ecology, Age, Life cycle, *Panama.

The mortality rate of mangrove seedlings in Panama was inversely correlated with initial propagule size. The species with small propagules appear to establish new cohorts annually but die quickly, while those with larger propagules have over-lapping cohorts on the swamp floor

BREEDING BIRDS OF RIPARIAN WOODLAND IN SOUTH-CENTRAL ARIZONA,
Arizona State Univ., Tempe.
N. E. Stamp.
Condor, Vol. 80, p. 64-71, 1978. 3 fig, 3 tab, 24 ref.

Descriptors: *Birds, *Riparian land, *Habitats, *Vegetation effects, Riparian plants, Wetlands, Ecology, Cottonwoods, Mesquite, *Arizona, Ecological distribution.

Bird species diversity (BSD) of cottonwood and mesquite habitats of the Southwest appear to be correlated with foliage height diversity (FHD). For cottonwood habitats in Arizona, BSD was correlated with percent vegetative cover (PVC), a measure of foliage volume (FV). BSD was weakly correlated with FV, determined by the point-quarter method for riparian woodland habitats on the Verde River in Arizona. FHD, PVC and FV appear to be indefinite predictors of BSD. Breeding birds should be censused on study plots for consecutive years due to fluctuations in species diversity from year to year with seasonal measurements of habitat structure, fruit crops, and other resources to determine the relationship between vegetative structure and avian populations. SUMMARY OF AVAILABLE INFORMATION ON CHESAPEAKE BAY SUBMERGED VEGETATION,
Maryland Univ., Cambridge. Horn Point Environmental Lab.
J. C. Stevenson, and N. M. Confer.
Fish and Wildlife Service, Office of Biological Sciences, FWS/OBS-78/66, August, 1978. 335, 50 fig, 88 tab, 747 ref.

Descriptors: *Submerged plants, *Bays, *Ecological distribution, Environmental effects, Aquatic plants, Estuaries, Pondweeds, Widgeon grass, Aquatic weeds, Rooted aquatic plants, Aquatic environment, Distribution patterns, Model studies, Publications, Plant ecology, Effluents, Wastes, Water pollution effects, Heavy metals

There are approximately eleven species of submerged aquatic vegetation (SAV) dominant in the wates of the Chesapeake Bay. These species tend to inhabit the shallow, shoreline areas of the Bay and its subestuaries, primarily limited to depths of three meters or less. Species vary as to salinity and temperature tolerances, morphology, preferred bottom substrate, susceptibility to chemical pollutants and general distribution. In order to determine the probable cause or cause for the changing patterns in submerged vegetation, the various factors that are known to affect the grasses have been analyzed to the extent possible given the availability of published and unpublished literature. Included among these factors are agrochemicals, turbidity, salinity, temperature, pH, wave action, fauna epiphytes, bicarbonate ion, chlorine, diseases, boat traffic, dredging, nutrient loading, petroleum and heavy metals. In order to assess these impacts and correlate them to a Baywide decline in submerged grasses, environmental factors can be initially separated into short-term, localized impacts or factors

that impact the Bay as a whole or on an aggregate basis such as the upper, middle, or lower Bay areas. Once the relative impacts of the known factors applicable to SAV growth and development have been analyzed, it becomes possible to apply mathematical modeling techniques to the Bay estuarine system. (Steiner-Mass)

SEASONAL IONIC FLUCTUATIONS IN A PHRAGMITES COMMUNIS COMMUNITY,
Carleton Univ., Ottawa (Ontario). Dept. of Biology.
I. L. Bayly, and T. A. O'Neill.
Canadian Journal of Botany, Vol. 50, No. 10, p. 2103-2109, 1972. 7 fig, 28 ref

Descriptors: *Marsh plants, *Nutrients, *Plant growth, Wetlands, Marshes, Calcium, Magnesium, Potassium, Sodium, Phosphorus, Grasses

Calcium, magnesium, potassium, sodium, and phosphorus concentrations were measured in the shoots of a phragmites communis community and its natural substrates during the growth season of 1969. Shoot length and shoot moisture were determined as indicators of physiological age. In addition, organic decay was followed by determination of the soil organic matter content and cation exchange capacity. Of the ions studied, calcium apparently increased in the shoot tissue, and magnesium, potassium, and phosphorus apparently decreased in the shoot tissue during the course of the growing season. Some speculations regarding the direction of net nutrient on flow in this community are advanced. (Steiner-Mass)

ECOSYSTEM AND MACROPHYTE PRIMARY PRODUCTION OF THE FORT RIVER, MASSACHUSETTS,
Amherst Coll., MA. Dept. of Biology.
S. G. Fisher, and S. R. Carpenter
Hydrobiologia, Vol. 49, No. 2, p. 175-187, May 31, 1976. 4 fig, 6 tab, 52 ref

Descriptors: *Aquatic plants, *Primary productivity, *Ecosystems, *Massachusetts, Rivers, Food webs, Decomposition, Streams, *Fort River(Mass)

Whole ecosystem gross primary production in the Fort River, measured using diurnal oxygen techniques, ranged from 0.44 g 02/sq m per day in winter to 6.50 g 02/sq m per day for 12 months. Mean ecosystem respiration was 3.65 g 02/sq m per day for 12 months. Macrophyte gross production (59.9 g 02/sq m per year) constitutes 9.2 percent of annual ecosystems productivity and 15.2 percent of summer primary production. Macrophytes were little grazed and entered food webs only after death, as detritus. Decomposition occurred near the site of production at relatively rapid rates, thus transport of dead macrophyte material in stream water was low. Data from this and other stream ecosystems suggest that, in general, streams are only moderately productive ecosystems which depend to varying degrees on watershed derived organic matter inputs. (Howard-Mass)

PHENOLOGY, DISTRIBUTION, AND SURVIVAL OF ATRIPLEX TRIANGULARIS WILLD. IN AN OHIO SALT PAN,
Ohio Univ., Athens. Dept. of Botany
K. A. McMahon, and I. A. Ungar
The American Midland Naturalist, Vol. 100, No. 1, p. 1-14, July, 1978. 4 fig, 7 tab, 33 ref

Descriptors: *Salt marshes, *Rooted aquatic plants, *Life history studies, *Ecological distribution, *Phenology, Saline soils, Soil moisture, Soil temperature, Wetlands, Ecology, *Ohio, Competition

Germination of Atriplex triangularis Willd. occurred between February and May in an Ohio salt pan. Flowers appeared in mid-July; seed development began in September. Senescence and death followed in late October. Soil Temperature of 15 degrees C appeared to trigger germination. High soil moisture values with consequent low soil salinity were prevalent during the genrmination period. Seedling establishment was particularly sensitive to salinity with severe mortality occurring in late spring and early summer when soil salinity began to climb. The highest concentration of soil salts coincided with the flowering stage in July and August when soil moisture values dropped severely due to low rainfall and high evaporation. By the seed development and maturation stage in September, soil moisture levels had begun to rise and total soil salts decreased. Of the four vegetation zones in the salt pan, germination and survival of A. triangularis were restricted in the main to the Atriplex zone. The establishment of A. triangularis in the Meadow and Hordeum zones was hindered by competition from other vegetation. High soil salinity within the Pan zone prevented germination of A. triangularis. (Howard-Mass)

ANNUAL METABOLISM OF A TEMPORARY POND ECOSYSTEM,
Cornell Univ., Ithaca, NY. Section of Ecology and Systematics
J. Cole, and S. G. Fisher
The American Midland Naturalist, Vol. 100, No. 1, p. 15-22, July, 1978. 3 fig, 1 tab, 25 ref

Descriptors: *Ponds, *Seasonal, *Productivity, *Rooted aquatic plants, Respiration, Wetlands, Ecology, Plankton, Aquatic plants, Aquatic animals, *Massachusetts, *Ecosystem, Ecology, Water level fluctuations, Water level, Metabolism

Whole ecosystem gross primary production and ecosystem respiration in Lost Pond, Massachusetts, estimated by diurnal oxygen techniques, were 2140 and 2669 kcal sq m per year, respectively. The plankton component represents only a small fraction of ecosystem metabolism. The benthic component, consisting of macrophytes, epiphytes, and sediment organisms, is the most active metabolic component of the ecosystem, particularly during the ice-free season. Macrophytes represent the major authochthonous organic matter input to Lost Pond. The fluctuating water level, by periodically exposing macrophytes, appears to exert a controlling influence on macrophyte decomposition and, therefore, may indirectly control the availability of certain nutrients in the water column. (Howard-Mass)

NUTRIENT AND WATER LEVELS IN A SMALL MICHIGAN BOG WITH HIGH TREE MORTALITY,
Michigan Univ., Pellston Biological Station
C. R. Schwintzer
The American Midland Naturalist, Vol. 100, No. 2, p. 441-451, October, 1978. 3 tab, 39 ref

Descriptors: *Bogs, *Nutrients, *Water levels, Wetlands, Ecology, *Michigan, Peat, Trees, Potassium, Nitrogen, Phosphorus, Calciu, Magnesium, Vegetation

Bryant's Bog consists of two concentric zones, a free-floating and a grounded mat surrounding a central pool. The vegetation of the two zones differed in species composition, biomass and extent of tree mortality from 1969-1975. The grounded mat had less biomass and more tree mortality. Midsummer values in 1974 and 1975 of 17 chemical and physical parameters of shallow groundwater (15-30 cm below the surface) were not significantly different (P greater than 0.05) between the two zones or the two summers. The shallow groundwater had the low Ca + Mg concentrations characteristic of ombrotrophic bogs, moderatley acid pH values characteristic of weakly minerotrophic bogs, and moderate concentrations of K, P and N. The ca + Mg and pH values were comparable to those in six other bogs in the area while K, P and N concentrations were noticeably higher in Bryant's Bog. The pattern of tree mortality was consistent with changes in water levels in lakes and streams in the region. Depth from the surface to the water level was significantly greater on the free than the grounded mat. Variations in water levels are the most probable cause of tree mortality and differences in vegetation of the two zones. (Howard-Mass)

MINERAL CONCENTRATIONS IN PAPYRUS IN VARIOUS AFRICAN SWAMPS,
Nairobi Univ. (Kenya). Dept. of Botany
J. J. Gaudet.
Journal of Ecology, Vol. 63, No. 2, p. 483-491, July, 1975. 1 fig, 8 tab, 12 ref.

Descriptors: *Swamps, *Environmental effects, *Nutrients, Wetlands, Marsh plants, Grasses, Distribution, Standing crop, Papyrus.

Papyrus swamps are generally located in areas of equatorial climate where winter-summer seasonal differences are small. But at the latitudinal limits of the present range of papyrus in Africa, winter and summer seasons become evident. Plants collected during the winter season north of the equator at Lake Tana in Ethiopia, and south of the equator on the Shire River in Malawi contain lower levels of most elements. Standing crop could well be lower for papyrus populations in such regions, and this in turn might affect the level of nutrient uptake. The mean mineral concentrations and range in concentration in papyrus are like those of other swamp emergents in that they are low compared to other aquatics. (Steiner-MAss)

THE RELATIONSHIP BETWEEN STANDING CROP IN SEDGE MEADOWS AND SUMMER TEMPERATURE,
Minnesota Univ., Minneapolis. Dept. of Botany
E. Gorham
Journal of Ecology, Vol. 62, No. 2, p. 487-491, July, 1974. 1 fig, 1 tab, 15 ref.

Descriptors: *Marsh plants, *Standing crop, *Temperature, Wetlands, Growth rate, Heat, Seasonal, Summer, Productivity, Marshes

Despite low values in extreme northern and montane sites, sedge standing crop is not significantly correlated with length of growing season. It is, however, closely correlated with the highest monthly mean temperature. Carex bigelowii at 1840 m on Mt. Washington experienced about 26 degree-days to reach a peak standing crop of about 180 g/sq m in midsummer. C. rostrata at 1455 m in the Canadian Rockies experienced about 68 degree-days to reach a midsummer peak of about 750 g/sq m, whereas C. rostrata in Minnesota experienced about 1290 degree-days to reach about 1100 g/sq m in midsummer. The highly productive stand of C. lacustris in New York State experienced about 1770 degree-days to peak at 1470 g/sq m in mid-September. There is a strong correlation, therefore, between standing crop and heat-unit accumulations, despite the limitations of the heat-unit concept. (Steiner-Mass)

CHEMICAL INPUTS BY A COLONY OF FRANKLIN'S GULLS NESTING IN CATTAILS
Minnesota Univ., St. Paul. Dept. of Ecology and Behavioral Biology.
J. G. McColl, and J. Burger
The American Midland Naturalist, Vol. 96, No. 2, p. 270-280, October, 1976. 2 fig, 4 tab, 23 ref.

Descriptors: *Freshwater marshes, *Cattails, *Nutrients, *Gulls, Life cycles, Ecology, Marshes, Wetlands, Nitrogen, Potassium, Sodium, Magne-

sium, Calcium, Sediments, Rooted aquatic plants, Wildlife.

Large increases occurred in N and P concentrations of water in the immediate vicinity of a nesting Franklin's gull colony in Agassiz Natonal Wildlife Refuge, Minnesota. Peak concentrations were concomitant with the peak of gull nestbuilding and feeding activities in mid-May and mid-July. About 36% of the annual P input to the pool with the gull colony is attributable to the gulls. Nutrient concentraton in inflow and outlet water of both the pool with a gull colony and one without remained relatively constant throughout the year due to nutrient absorption by the pool sediments. The gull colony had little effect on the concentrations of Na, K, Ca, and Mg in water. Outlet waters of both pools had higher K concentrations than inputs due to release of the element by the sediments to water or by nutrient uptake by cattails and subsequent leaching of both dead and living cattails. Most nutrients accumulated in the sediments, especially in the pool with the gull colony. Most nutrients accumulated in the sediments, especially in the pool with the gull colony. The Refuge acts as a sink for nutrients in runoff from surrounding agricultural land. (Howard-Mass)

HABITAT SELECTION BY WATERFOWL OF ARGENTINE ISLA GRANDE,
Iowa State Univ., Ames. Dept. of Zoology and Entomology.
M. W. Weller.
Wilson Bulletin, Vol. 87, No. 1, p. 83-90, March, 1975. 1 fig, 1 tab, 13 ref.

Descriptors: *Waterfowl, *Habitats, *South America, Ducks, Geese, Swans, Marshes, Estuaries, Lakes, Broods, Wetlands, *Argentine Isla Grande.

During a month-long study of habitat selection and of seeding behavior of waterfowl, 15 of the 17 species of waterfowl known to occur on the island were seen. Habitat segregation of breeding waterfowl was quite distinctive and resembled the pattern of the same species in the Falkland Islands. Different species of Sheldgeese, associated with various habitat types including exposed rocky seashore, shortgrass meadows in open or semiwooded country, and streams and lakes in densely wooded areas, during the breeding season, are a good example of presumed ecological isolation. In estuarine areas, steamer ducks, which feed by diving, have little overlap in food use with dabbling ducks of the genus Anas. Dabbling ducks overlapped most in freshwater marshes but, even there, seemed to be segregated by feeding sites and feeding behavior. (Howard-Mass)

PRODUCTION, NUTRIENT CONTENT AND DECOMPOSITION OF PHRAGMITES COMMUNIS TRIN. AND TYPHA ANGUSTIFOLIA L.,
University of East Anglia, Norwich (England) School of Biological Sciences.
F. F. Mason, and R. J. Bryant
Journal of Ecology, Vol 63, No 1, p 71-95, March, 1975 5 fig, 12 tab, 45 ref, 1 append

Descriptors: *Freshwater marshes, *Productivity, *Nutrients, *Decomposing organic matter, Cattails, Reeds, Wetlands, Swamps, Marshes, Eutrophication, Europe, Rooted aquatic plants, Aquatic plants.

Shoots of Phragmites and Typha emerged in April in reedswamps at Alderfen Borad, Norfolk. The peak shoot density of Phragmites, occurring in July, was 127 sq m in 1972 but decreased to 72/sq m the following year due largely to grazing by coypus. Loss of dead standing shoots occurred mainly in the spring and summer--some dead shoots surviving for over two years. Typha shoots reached a maximum density of 100/sq m in May 1973 and thereafter declined steadily through a self-thinning process. The peak standing crop of Phragmites was 942 g dry wt/sq m in 1972 and 524 g/sq m in 1973 and that of Typha 1118/sq m in 1973. The net productivity was estimated as 1080 g/sq m and 551 g/sq m in the two years for Phragmites and 1445 g/sq m for Typha in 1973. Growing shoots of Phragmites and Typha showed marked, and different, seasonal changes in nutrient content; seasonal changes in rhizomes were also detected. Phragmites decomposed at a faster rate than Typha. The reedswamp released large amounts of nutrients into Alderfen Broad during the winter. (Howard-Mass)

AN INVESTIGATION OF THE BIOTIC FACTORS DETERMINING THE RATES OF PLANT DECOMPOSITION ON BLANKET BOG,
Durham Univ. (England). Dept. of Zoology.
J. C. Coulson, and J. Butterfield.
Journal of Ecology, Vol. 66, No. 2, p. 631-650, July, 1978. 15 tab, 16 ref.

Descriptors: *Bogs, *Peat, *Decomposing organic matter, Rates, *Soil types, Organic matter, Wetlands, Ecology, Aquatic plants, Microbial degradation, Soil micro-organisms, Invertebrates, Insects, Nutrients, Nitrogen, Phosphorus, Fertilization, Europe.

The chemical composition of a plant species is of paramount importance in determining the rate of its decomposition on blanket bog in the northern Pennines. Peat accumulation is primarily the result of the intrinsic slow decay rate of some of the species in the plant community. The average rate of microbial decomposition of the same substrates was similar at peat and at mineral soil sites. The role of animals in the decomposition of plant materials differed markedly according to both the soil type and the plant species of the substrate. The decomposition losses attributed to microorganisms and to animals were not significantly correlated. Compared to mineral soils, peat contained a lower overall density of soil animals. The rates of microbial decomposition were highly correlated with the plant P or N concentration on both soil types. When animal contribution to decomposition was included this correlation became nonsignificant on the peat. Plant material enriched with N showed increased decomposition rates while that enriched with P did not. (Howard-Mass)

GEOGRAPHICAL VARIATION IN BRITISH SALTMARSH VEGETATION,
Cambridge Univ. (England). Botany School.
P. Adam.
Journal of Ecology, Vol. 66, No. 2, p. 339-366, July, 1978. 5 fig, 94 ref, 2 append

Descriptors: *Salt marshes, *Vegetation, Regions, Europe, Marshes, Wetlands, Ecology, Plant populations, Ecological distribution, Aquatic plants.

Three types of saltmarshes around the British coast were recognized from cluster analysis and principal coordinates analysis of the noda occurring at 133 marsh sites. One type is largely restricted to south-east England and at present is normally ungrazed. A second type is largely restricted to the Irish Sea coast of England and Wales and most examples are grazed. The third type is characteristics of loch-head marshes on the west coast of Scotland. It is suggested that the saltmarsh types have arisen through the interaction of sediment type, climatic, biotic and historic factors. Of these, the most important determinant of the vegetation types on saltmarshes in England and Wales is past and present land use. A regional differentiation of saltmarsh vegetation into four major 'natural' types is postulated. (Howard-Mass)

SCOUR AND FILL PATTERNS IN POOL-RAPID RIVERS,
Arizona Univ. Tucson. Dept. of Civil Engineering and Engineering Mechanics.
E. Silverston.
Available from the National Technical Information Service, Springfield, VA. 22161 as PB-290 584. Price codes: A05 in paper copy, A01 in microfiche. Master of Science Thesis, 1975. 85p, 36 fig, 1 tab, 7 ref, append. OWRT A-038-ARIZ(1), 14-31-0001-4003.

Descriptors: Degradation, Erosion, *Scour, Rivers, River flow, Sediments, *Sediment transport, *Distribution patterns, River behavior, Stream morphology

Sediment carrying pool-rapid rivers are abundant in the United States. However, not much is known about the behavior of the pool beds. It is known that with an increase in the flow that sediment eventually is scoured from the bed and when the flow is decreased the bed elevation eventually increases, but what actually occurs before the final equilibrium bed configuration is attained can only be approximated. It is a reasonable assumption that the bed elevation fluctuates due to scour and deposition, until the final equilibrium bed configuration is attained. An approximate analysis of the scour and fill patterns of the pool-rapid river was made to predict the scour and fill patterns of pool-rapid rivers. A numerical model was analyzed to better account for what actually happens to the pools. The results of the analysis verified that when there was a change in the flow that the pool bed had fluctuated by scouring or filling, and that the time period until equilibrium would occur varied by several orders of magnitude.

TRANSPORT OF A NONCOHESIVE SANDY MIXTURE IN RAINFALL AND RUNOFF EXPERIMENTS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia)
P. H. Walker, P. I. A. Kinnell, and P. Green
Soil Science Society of America Journal, Vol. 42, No. 5, p 793-801, September-October 1978. 8 fig, 3 tab, 20 ref

Descriptors: *Impact(Rainfall), *Soil erosion, *Bed load, *Suspended solids, Erosion, Laboratory tests, Simulated rainfall, Particle size, Rainfall, Runoff, Erosion, Soils, Sands, Sediment transport, Flow, Storms, Precipitation(Atmospheric), Soil science

Rainfall intensities of 45, 100, and 150 mm/hr with systematically varied kinetic energies were applied to a saturated noncohesive, sandy bed 3 m long and set at slopes of 0.5 and 5%. Detailed size analyses of solids discharged showed that the less than 31-micrometer fraction was mobilized most readily and behaved as a suspended load; the 31- to 250-micrometer fraction was transported slowly, much apparently as saltating bed load; the 0.25- to 4-mm fraction was transported rapidly, grains tending to move as rolling bed load; the greater than 4-mm fraction behaved as a lag gravel. The sedimentary properties of deposits described the differentiation of various size fractions and minerals in the original mixture. The results showed raindrop impacts within the flow were important in promoting transport of solids than the aerial component of splash. Under conditions where overland flow had developed, transport of

solids was related directly to rainfall intensity and variations in rainfall energy that were associated with variations in raindrop impact frequency. Increases in rainfall energy due to increasing raindrop sizes did not result in increases in solids discharged. (Sims-ISWS)

WIND EROSION AND DEPOSITION ALONG A COASTAL SAND DUNE,
Delaware Univ., Newark. Coll. of Marine Studies.
R. J. Lai, and J. Wu
Sea Grant Technical Report No. DEL-SG-10-78, September 1978. 31 p, 9 fig, 17 ref.

Descriptors: *Erosion, *Deposition(Sediments), *Dunes, *Wind erosion, Sediment transport, Coasts, Laboratory tests, Wind force.

When wind blows over a coastal dune, the effective wind force and sand-transport rate vary significantly along the surface of the dune. Erosion and deposition of sand along the dune surface depend on dynamic wind force, local dune geometry, and sand-grain size. These parameters have been studied from laboratory modeling and numerical calculation. The results indicate that erosion depends strongly on wind velocity and local slope of the dune surface. Furthermore, while it affects only slightly the total sand transport rate from the dune, the size of the sand grains significantly affects the distribution of the transport rate and, consequently, the erosion and deposition areas along the dune. CYCLIC WETTING AND DRYING OF THE SOIL ZONE AS AN INFLUENCE ON THE CHEMISTRY OF GROUND WATER IN ARID TERRAINS,
Wyoming Univ., Laramie. Dept. of Geology; and Geological Survey, Denver, CO. Geologic Div.
J. I. Drever, and C. L. Smith
American Journal of Science, Vol 278, p 1448-1454, December 1978. 6 fig, 1 tab, 8 ref.

Descriptors: *Chemical reactions, *Soil water, *Wetting, *Drying, *Arid lands, Rainfall, Cloudbursts, Saline soils, Solutes, Evaporation, Salts, Laboratory tests, Analytical techniques, Leaching, Groundwater, Springs, *Re-solution of salts.

In arid climates, occasional heavy rains cause partial re-solution of salts deposited in the soil and vadose zone. The kinetics of re-solution of these salts were studied in the laboratory by evaporating waters of different composition in a sand tray and then leaching the sand with distilled water. The relative rates of dissolution were Na and Cl most rapid, the K, SO_4, Mg, Ca, carbonate species and finally SiO_2. Processes of evaporation followed by re-solution can give rise to a solution composition depleted in SO_4, Mg, and SiO_2 relative to chloride, even though the solution is undersaturated with respect to minerals containing these elements. The process explains well the chemistry of springs in the Teels Marsh Basin, Nev., and may complicate mass balance calculations relating water chemistry to rock weathering. (Woodard-USGS)

NITRATE ACCUMULATION IN SOILS AND LOSS IN TILE DRAINAGE FOLLOWING NITROGEN APPLICATIONS TO CONTINUOUS CORN,
Minnesota Agricultural Experiment Station, St. Paul.
R. G. Gast, W. W. Nelson, and G. W. Randall
Journal of Environmental Quality, Vol. 7, No. 2, p 258-261, April-June, 1978. 1 fig, 4 tab, 9 ref.

Descriptors: *Nutrient removal, *Denitrification, Nitrates, *Tile drainage, Water pollution, Sweet corn.

Nitrate-N concentration in tile water, loss from tile lines, and accumulation in soil profiles were determined following each of three annual applications of 20, 112, 224, and 448 kg N/ha to continuous corn (Zea mays L.) grown on a Webster clay loam (Typic Haplaquoll) in southern Minnesota. Plots were isolated to a depth of 1.8 m with plastic to allow an accurate assessment of the area drained. There was relatively little increased NO_3-N accumulation in the soil profile or loss from tile lines at the recommended application rate of 112 kg N/ha compared to that for the check treatment. Nitrate-N losses through tile lines in 1975 (after 3 years treatment) were 19, 25, 59, and 120 kg/ha for the 20, 112, 224, and 448 kg N/ha applications, respectively, which had NO_3-N accumulations in the 0-3 m soil profiles of 54, 100, 426, and 770 kg NO_3-N/ha. Maximum NO_3-N accumulation in the soil profiles occurred at a depth of about 1 m with little evidence of movement below about 2.2 m. (Skogerboe-Colorado State)

T. F. Lytle, J. S. Lytle, and P. L. Parker.
Gulf Coast Research Reports, Vol. 4, No. 2, p. 214-232, November, 1973. 6 fig, 5 tab, 17 ref.

Descriptors: *Marsh plants, *Salt marshes, *Trace metals, *Geochemistry, Wetlands, Marshes, Sediments, Metals, Organic matter, Gulf Coastal Plain, Soil contamination, Water pollution, Pollutant identification, Bioassay, Indicators, Soil analysis.

The marsh plants as a whole have exhibited an ability about as strong as terrestrial and marine plants in accumulating a variety of trace metals from their environment. In some cases the marsh plants may act as sources for trace metal enrichment in the sediments and in other instances, notably molybdenum, as an active depleting agent. The coastal marsh environment widespread among Gulf and Atlantic coastlines will undoubtedly continue to be a primary target of heavy metal pollution. The varying degrees of enrichment of the various elements both essential and nonessential in marsh plants should make them of value in establishing base-line evaluations of heavy metal inventories in a coastal area. CHEMICAL CHARACTERIZATION OF THE GASEOUS AND LIQUID ENVIRONMENTS OF SUBSURFACE DRAIN SYSTEMS,
Agricultural Research Service, Brawley, CA. Imperial Valley Conservation Research Center.
B. D. Meek, L. B. Grass, and A. J. MacKenzie
Soil Science Society of American Journal, Vol. 42, No. 5, p. 693-698, September-October 1978. 3 fig, 6 tab, 14 ref.

Descriptors: *Subsurface drains, *Chemical precipitation, *On-site investigations, Solutes, Gases, Soil gases, Drainage systems, Tile drains, Tiles, Iron, Manganese, Chemicals, Oxygen, Dissolved oxygen, Carbon dioxide, Oxidation-reduction potential, Chemistry, Water chemistry, California, *Imperial Valley(CA).

Chemical composition of subsurface drain effluent was determined in the field as a function of location (various depths and soil textures), entry point of the solution into the drainpipe, and distance from outlet (with or without a water trap). Liquid samples were analyzed for Fe, Mn, NO_3-N, HCO_3, organic carbon, electrical conductivity, pH, and dissolved oxygen, and gas samples were analyzed for O_2 and CO_2. Manganese ranged from less than 0.1 to 6.1 ppm and Fe ranged from less than 0.1 to 14.2 ppm which illustrated the wide range of oxidation-reduction conditions present in the soils drained by subsurface drain lines. Chemical composition changed little during the season. Water entering the upper portion of the drain line was lower in Mn, which was the result of shor

flow paths through soil zones with higher O2 levels, than the water moving through longer flowlines which entered the bottom of the drains. The solutions in the drain lines were undersaturated with respect to the drain line atmosphere, which indicated that O2 flows downward through the drain trench backfill. This is an important factor in the oxidation of Fe and Mn in subsurface drain lines. However, longitudinal movement of O2 into drain lines, via the outlets, is a minor factor contributing to the precipitation of Fe and Mn and does not account for the extensive amount of precipitation of Fe or Mn within the drain system. SAMPLING OF GROUNDWATERS FOR CHEMICAL ANALYSIS,
Alberta Research Council, Edmonton. Groundwater Div.
E. Wallick.
In: Contributions to the Hydrogeology of Alberta, Bulletin 35, Alberta Research Council, Edmonton, p 19-30, 1977. 11 fig, 2 tab, 7 ref.

Descriptors: *Sampling, *Water chemistry, *Chemical analysis, *Groundwater, Surveys, Wells, Water wells, Chemicals, Headness(Water), Alkalinity, Iron, Silicates, Carbonates, Hydrogen ion concentration, Chemistry, Chemical reactions, Analytical techniques, Hydrogeology, Groundwater sampling.

Groundwater chemical systems are often unstable when exposed to surface conditions, so incorrect values for certain chemical parameters may result when samples are analyzed. Determination of the equilibrium chemical state of groundwater from the thermo-dynamic constants requires that input ionic concentrations be representative of field pressure and temperature conditions. Test samples from east-central Alberta showed that low values for hardness, alkalinity, and total iron were obtained if no attempt was made to preserve the samples. It was found that by collecting three samples, one untreated, one acidified to pH = 1 for laboratory analysis, and one untreated to field analysis of pH, temperature and conductivity, accurate determination of chemical components could be made. MINERALIZATION, IMMOBILIZATION AND NITRIFICATION,
California Univ., Davis. Dept. of Land, Air and Water Resources.
F. E. Broadbent.
In: National Conference on Management of Nitrogen in Irrigated Agriculture, p 109-134, 1978. 5 fig, 33 ref.

Descriptors: Nitrogen, *Nitrification, Ammonia, Decomposing organic matter, Soil microorganism, Inorganic compounds, Pollutants, Inhibitors, *Mineralogy.

The decomposition of organic substances containing nitrogen through the activities of soil microorganisms and resulting in the release of some of the nitrogen as ammonia is called nitrogen mineralization. Net mineralization occurs when the quantity of nitrogen in the material undergoing decomposition exceeds the needs of the microbial population for nitrogen to produce new cells. If the decomposing substances do not contain enough nitrogen to meet the needs of the microbial population, any inorganic nitrogen present in the soil will be utilized by the microbes and converted to cell protein and other nitrogenous compounds. This process is called immobilization. In a sense the assimilation of inorganic nitrogen by growing plants is also immobilization, but this discussion considers only the microbiological process. The nitrogen supplying capacity of soils depends to a large extent on rates of mineralization and immobilization. Various procedures have been utilized to obtain estimates of nitrogen mineralization over a growing season, the most successful of which have been based on incubation of soil samples under controlled conditions for a few weeks. Desirable management practices should favor not only efficient utilization of fertilizer nitrogen, but also maximum crop uptake of mineralized nitrogen. Experiments with isotopically labeled fertilizers indicate that these two objectives are compatible with each other and also with the need to minimize leachable nitrate. CONTRIBUTED PAPERS ON COASTAL ECOLOGICAL CHARACTERIZATION STUDIES, FOURTH BIENNIAL INTERNATIONAL ESTUARINE RESEARCH FEDERATION CONFERENCE, OCTOBER, 1977.
Fish and Wildlife Service, Washington, DC. Office of Biological Services.
Report FWS/OBS-77/37, April, 1978. 66 p.

Descriptors: *Systems analysis, *Estuaries, *Model studies, *Coasts, Coastal plains, Ecology, Ecosystems, Wetlands, Management, Marsh management.

Six papers present, discuss, and give examples of the U. S. Fish and Wildlife Service's coastal ecological characterization. An ecological characterization is a description of the important components and processes of an ecosystem with an emphasis on the understanding of functional relationships. Characterizations will be available for use by all FWS programs related to coastal resource management and planning. Other applications are assessing the Outer Continental Shelf development, Coastal Zone Management, and Section 208 water quality planning. Characterizations will identify fish and wildlife populations and their habitats that could be impacted during ecological emergencies such as oil spills. (See W79-03698 thru W79-03703) (Steiner-Mass)

COASTAL ECOLOGICAL CHARACTERIZATION-AN OVERVIEW,
National Coastal Ecosystems Team, NSTL Station, MS.
J. B. Johnston.
In: Contributed Papers on Coastal Ecological Characterization Studies, Fourth Biennial International EStuarine Research Federation Conference, October, 1977. Fish and Wildlife Service, Office of Biological Services, FWS/OBS-77/37, April, 1978. p 1-3.

Descriptors: *Coastal plains, *Ecosystems, *Systems analysis, Coasts, Structural models, Structure, Ecology, Hydrology, Land management, Productivity, Simulation analysis, Estuaries

The U.S. Fish and Wildlife Service, in response to accelerated development pressures upon the coastal zone of the United States and its territories, has developed an ecological characterization approach for describing these valuable areas. Characterizations integrate functionally the major elements of an ecosystem. Elements include, but are not limited to, physiography and geology, climate, and physical transport mechanisms. Examples of physical transport mechanisms are hydrology, sediment flux, physical oceanography, energy flows and trophic relationships, and atmospheric transport. Characterizations describe the important species, populations, and communities in the ecosystem, with particular emphasis on those organisms perceived as being of importance (recreational or commercial) to man or vital to the natural functioning of the ecosystem being studied. Population estimates do not require precise statistical sampling, but where feasible, estimates are to address the extent and causes of natural variation. The main objective of a characterization is to describe socio-economic, physical, and biological features as interacting components, thereby establishing a foundation upon which impacts of man, including modifications to the ecosystem, can be predicted. Descriptors: *Salt marshes, *Wildlife habitat, *Saline soils, Wetlands, Birds, Mammals, Land use, Water pollution, Wildlife management.

Saline marshes and steppes along the Danube in southern Slovakia lie on the northern-most border of the complex of Central American saline soil. The ecology of the saline localities studied is outlined on the basis of 48 bird and 18 mammal species. Some birds are confined to the saline localities studied because they are relatively well conserved and extensive rather than because they are saline. The root vole, Microtus oeconomus, known only from the area studied, and the lizard Lacerta vivipara, living in isolated populations in mountainous areas, are the only known vertebrate relics. Some functional aspects of the animals studied are stressed. The saline localities are threatened by reclamation for agricultural use, by fire, drainage and lowering the underground water table, but primarily by pollution from both oily water and the dumping of reuse. THE COMMUNITY STRUCTURE OF A TROPICAL MARINE LAGOON,
Dade County of Environmental Resources Management, Miami, FL.
R. F. Holm.
Estuarine and Coastal Marine Science, Vol. 7, No. 4, p. 329-345, October 1978. 9 fig, 4 tab, 44 ref.

Descriptors: *Lagoons, *Tropical regions, *Florida, *Biological communities, On-site investigations, Benthos, Benthic fauna, Phytoplankton, Tidal waters, Sediments, Sampling, Organic matter, Vegetation, Coasts, Shores, *Florida Keys, *Biscayne Bay(FL).

The structure of the benthic community in a nearshore tropical marine lagoon, in the upper Florida Keys, was examined in early spring and midsummer in 1973 and 1974. Eight environmental parameters (water depth, tidal range, current flow, water temperature, salinity, pH, sediment depth, and particle size) were monitored. The biota was compared along an intertidal-subtidal environmental gradient. The amount of vegetation present and the stability of the sediment modified the abundance and diversity of the benthic macrofauna. The results of this study were compared with those from other areas in the tropical Western Atlantic Ocean. The uniqueness of the lagunar environment made it possible to examine the changes in species abundance and diversity as a detritus-based food web graded into a phytoplankton based-food web. SAND AND GRAVEL OFFSHORE IN THE GREATER NEW YORK METROPOLITAN AREA: WHAT KIND AND HOW MUCH,
New York Sea Grant Inst., Albany.
D. Carlisle, and W. A. Wallace.
New York State Sea Grant Report Series No. NYSSGP-RS-78-13, (1978). 69 p, 14 fig, 5 tab, 7 ref, 12 map, 4 append.

Descriptors: *Mining, *Sands, *Gravels, *Environmental effects, Sediment transport, Sediment distribution, Dredging, *Resource availability, Environmental assessment, New York Bight, Offshore mining.

The area offshore considered appropriate to satisfy the Greater New York Metropolitan Area (G.N.Y.M.A.) demands for sand, gravel, and fi stretches from Atlantic City, New Jersey to th western border of Rhode Island. Data are presented and considered out to the 600-foot depth co tour although currently, the most favorable conditions for mechanical dredging are deposits ne shore in less than 30 feet of water. Data are pr sented at a level of detail sufficient for a region economic analysis. Even if only nominal growth the G.N.Y.M.A. by the year 2000 AD is consi ered, regional shortages of mineral aggregate w occur. Because of high transportation costs fo moving existing on-shore supply to demand site consumers and producers of sand and gravel w be forced to look offshore. Review of existi surveys indicates that large quantities of clean sa exist in the offshore reaches. A summary of of shore resources is given. Several problems w

emerge whenever mining occurs since the resource is located near shore. Conflicts will exist with local shellfishing interests. These conflicts may have either primary impact (direct disturbance of shellfish beds by dredging apparatus) or indirect impact (dumping of silt effluent which can cover and contaminate shellfish areas). 3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

PRODUCTION AND CONSERVATION OF FRESH WATER,
Democritus Nuclear Research Center, Athens (Greece).
A. Delyannis, and E. Delyannis.
Chemical Engineering In a Changing World, p. 313-324. 14 ref. (1977).

Descriptors: *Desalination, *Desalination processes, *Water purification, Water treatment, Distillation, Electrodialysis, Reverse osmosis, Water conservation, Water management(Applied), Saline water intrusion, Water reuse, Irrigation water, Aquifers, Orange County, California, Colorado River, Yuma, Arizona, Groundwater recharge.

The progress made in desalination of brackish and sea water is reviewed. The desalination processes, distillation, electrodialysis, and reverse osmosis, are discussed with attention given to the impact of rising fuel prices on the cost of converted water. In some areas, Orange County, California, for example, water from a distillation plant is blended with reclaimed municipal sewage water, and injected into the ground to create a fresh water barrier which prevents sea water intrusion into the underground aquifer. Plans are underway for a desalination plant on the Colorado River at Yuma, Arizona, to treat irrigation drainage for use by Mexico. The plant, about 100 million gallons per day in size, may include both reverse osmosis and electrodialysis. (Davison-IPA)

NEW POLYMERIC MEMBRANES CONTAINING PHOSPHONATE ESTER GROUPS FOR WATER DESALINATION,
Gulf South Research Inst., New Orleans, LA.
I. C. Cabasso.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 609, Price codes: A04 in paper copy, A01 in microfiche. Report January 1979. 62 p, 32 fig, 8 tab, 23 ref. OWRT No. 7545(1), 14-34-0001-7545.

Descriptors: *Membranes, *Reverse osmosis, Polymers, *Desalination processes, Membrane processes, Asymmetric membranes, Cellulose acetate, Poly(vinylpyridine), Polyphosphate, Alloy polymers.

Three novel polymer membranes for water desalination by reverse osmosis were originated and characterized. Two of these, alloy membranes, were composed of cellulose acetate/poly(bromophenylene oxide phosphonate) and cellulose acetate/poly(4-vinyl pyridine). The alloy membranes were cast as dense and asymmetric membranes. For the first alloy, CA/PPOBrP, two different structures have been identified for the asymmetric membrane: (1) the well known dense skin resting on an open-celled foam and (2) skin resting on a porous layer which displays a two-phase morphology. In the latter, dense spheres (0.1-1 micron) appear to grow out of a continuous polymer network. The second alloy, CA/PVPy, has the same morphology as cellulose acetate when cast as an asymmetric membrane. Both membranes have high water permeabilities and high salt rejections. The third membrane was an asymmetric PPOBrP membrane. This polymer was cast into an asymmetric membrane which displays a sharp boundary between the skin and the porous structure resembling a composite membrane. The presence of PPOBrP polymer in the alloys increases the membrane operation range, with respect to pH (up to pH 11) and free chlorine (approximately 100 ppm). The membranes cast from the homopolymer seem to have even better durability, but should be characterized further. The three novel membranes were tested under hydraulic pressures up to 1200 psi, producing fluxes of 5-40 gfd and salt rejections greater than 90 percent.

DESIGN, CONSTRUCTION, AND FIELD EVALUATION TESTS OF AN 10,000 GPD SKID-MOUNTED ALUMINA-LIME-SODA PILOT PLANT,
Midwest Research Inst., Kansas City, MO.
A. D. Tippit, E. P. Shea, and J. W. Nebgen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 755, Price codes: A05 in paper copy, A01 in microfiche. Technical Report (1978). 68 p, 7 fig, 22 tab, 3 append. OWRT (No 7546)(1), 14-34-0001-7546.

Descriptors: *Silica, Heavy metals, *Reverse osmosis, Brine, *Desalination processes, *Pilot plants, *Desalination plants, New Mexico, Dissolved solids, Operations, Silica removal, Water recovery, *Aluminum-lime-soda treatment.

A 10,000 gal/day skid-mounted alumina-lime-soda (ALS) pilot plant has been constructed and operated at the Office of Water Research and Technology Station at Roswell, New Mexico. The purpose of the pilot plant was to establish ALS operating parameters for removal of dissolved silica from reverse osmosis (RO) brines. Removal of silica foulant from RO brines permits further water recovery in additional RO stages. Results showed that dissolved silica could be routinely reduced to less than 12 mg/liter with the ALS process. Initial silica levels in the brine varied from 30 to 50 mg/liter. Optimum silica removal is accomplished in the pH range of 8.8 to 9.0. Common heavy metals were nearly quantitatively removed by the ALS process under optimum conditions for silica removal. Costs of the process range from $0.30/1,000 gal. to $0.35/1,000 gal. for waters initially containing 30 to 50 mg/liter of silica.

EXECUTIVE SUMMARY OF DESALTING PLANS AND PROGRESS, AN EVALUATION OF THE STATE-OF-THE-ART AND FUTURE RESEARCH AND DEVELOPMENT REQUIREMENTS,
Fluor Engineers and Constructors, Inc., Irvine, CA.
P. J. Schroeder, A. R. Khan, S. F. Mulford, A. S. Chan, and M. Gorry.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 786, Price codes: A03 in paper copy, A01 in microfiche. September 1978. 47 p, 11 fig, 20 tab. OWRT T-0024(No 7707)(1).

Descriptors: *Desalination, *Desalting technology, Technology transfer, Economic analysis, *Cost analysis, *Water demand, *Water supply, Brackish water, *Future planning(Projected), Forecasting, *Reviews, *Research priorities, Research and development.

The study revealed that there is a future need for desalting technology. The largest market today is overseas, but the future market in the U.S. is much larger than the overseas market (about six times as large). The U.S. need for desalted water is expected to be over five billion gallons per day (BGD) by 1985 and over 29 BGD by the year 2000. A breakdown of these totals by the source of water demand is presented. Raw water supplies would be divided about as follows: 15.8 BGD from plain brackish waters (no contaminants or toxicants), 12.3 BGD from difficult brackish waters (industrial effluent wastewaters), and 1 BGD from seawater. The minimum expected desalted water demand for the overseas market is 5.45 BGD, by the year 2000. The major portion of this market is in the Middle East. A breakdown of this market is provided. Saudi Arabia has the largest demand of any nation just to supply their minimum needs for domestic and industrial use. The effects of adding agricultural use and finally steam-electric use are illustrated. A breakdown of the desalting market in other countries is provided. (See also W79-03776)
W79-03775

DESALTING PLANS AND PROGRESS, AN EVALUATION OF THE STATE-OF-THE-ART AND FUTURE RESEARCH AND DEVELOPMENT REQUIREMENTS,
Fluor Engineers and Constructors, Inc., Irvine, CA
P. J. Schroeder, A. R. Khan, and S. F. Mulford.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 785, Price codes: A08 in paper copy, A01 in microfiche. Final Report, January 1978. 140 p, 24 fig, 28 tab, 25 ref. OWRT T-0024 (No 7707)(1).

Descriptors: *Reviews, *Desalination, *Technology transfer, Membranes, Distillation, Freezing, Economics, Evaluation, Cost projections, Market projection, Fixed costs, *Research priorities, *Future planning(Projected), Research and development.

An evaluation of the state-of-the-art of desalting technology (distillation, membranes, and freezing) was carried out. Potential desalting markets were estimated and present process economics were adjusted. Fully developed process economics were projected along with a development plan for each process. Cost and time requirements for each process development plan were estimated. A future market split among the three desalting processes is projected. A potentially large desalting market big enough to recover the future R and D investment in all three processes many times over is expected by the year 2000. The distillation process is still the best commercial and economical choice for seawater desalting and waste concentration. The freezing process can replace distillation at lower costs for desalting seawater and concentrating industrial effluents and waste waters if fully developed. However, this technology is presently undemonstrated commercially. Membrane processes have the greatest potential for cost reduction and are expected to dominate the desalting market for brackish and normal seawaters by the year 2000, and will have the largest market share. Seawater freeze desalting and seawater R.O. desalting water costs will be about a standoff when both processes are fully developed. (See also W79-03775)
W79-03776

APPARATUS FOR DESALINATING WATER,
R. E. Diggs
U.S. Patent No. 4,118,283, 19 p, 21 fig, 5 ref. Official Gazette of the United States Patent Office, Vol. 975, No. 1, p. 247, October 3, 1978.

Descriptors: *Patents, *Desalination, *Desalination processes, *Desalination apparatus, *Solar radiation, Separation techniques, Vapor compression distillation, Condensation.

A method and apparatus are disclosed in which water is heated utilizing solar energy and then transferred to a vacuum chamber where it is vaporized and the water vapor separated from the solid residue in a continuous flow process. The

water vapor is then transferred to a separate condensing chamber where it is condensed to form pure distilled water. Contaminated water flows across a grid and into a storage tank. The grid utilizes solar energy to heat that water to a predetermined temperature. A heat transfer structure which is dome-shaped and a preheater utilizing solar energy heats the water to a further predetermined temperature. An evaporator receives the heated water and exposes it to a vacuum condition so that the temperature of the water is above the saturation temperature. The water is thus vaporized, and solid contaminants are separated. The solids are deposited on a moving belt and are then moved into a solids removal system. Vapor transferring means removes the water vapor from the evaporator and transfers it to the heat transfer structure where it is condensed to form distillate which is free of solid contaminants. (Sinha-OEIS)

ELECTROCHEMICAL WATER DESALINATION PROCESS,
H. J. R. Maget
U.S. Patent No. 4,118,299, 11 p, 8 fig, 8 ref, Official Gazette of the United States Patent Office, Vol 975, No. 1, p. 252, October 3, 1978.

Descriptors: *Patents, *Desalination, *Desalination process, *Water purification, Sea water, Saline water, Electrochemistry, Electro-osmosis, Hydrogen, Electrodes, Desalination apparatus.

A process and apparatus are provided for purifying salt-containing water such as sea water, brackish water and mineralized water. The water stream is mixed with hydrogen and then pumped into an electrochemical cell where hydrogen is ionized into protons. These protons migrating to the counter-electrode, under the influence of an applied potential, entrain liquid water. At the counter-electrode, protons recombine to form hydrogen while releasing liquid water. Hydrogen is recycled and participates into the process only as a vehicle for the transport of water. This process is particularly applicable to the purification of water with high salt content. The process is carried out with two electrodes (an anode and a cathode as counter-electrode) separated by a cation exchange membrane. The cation exchange membrane is an important element in the process, since through its physical and chemical properties, it will prevent salt-containing water to flow directly to the counter-electrode (without undergoing the change from hydrogen gas to protons), will also prevent dissolved salts to migrate to the counter-electrode and will also provide a physical barrier between anode and cathode thus preventing mixing of impure and pure water streams.

3B. Water Yield Improvement

THE DEVELOPMENT AND PERPETUATION OF THE PERMANENT TAMARISK TYPE IN THE PHREATOPHYTE ZONE OF THE SOUTHWEST,
Rocky Mountain Forest and Range Experiment Station, Tempe, AZ
J. S. Horton
In: Importance, Preservation and Management of Riparian Habitat: A Symposium, July 9, 1977, Tucson, Arizona, USDA Forest Service General Technical Report RM-43, p. 124-127, 19 ref.

Descriptors: *Riparian plants, *Phreatophytes, *Southwest U.S., *Shrubs, Riparian land, Vegetation, Trees, Cottonwoods, Willow trees, Wetlands, Streams, Seeds, Competition, Drought resistance, *Saltcedar.

Saltcedar (Tamarix chinesis) became naturalized and by the 1920's was a dominant shrub along the Southwestern rivers. Its aggressive characters allow it to be a permanent dominant in much of the phreatophyte vegetation in this region. Saltcedar produces seeds over a much longer period than do native species, it can become established after a summer recession flow when seeds of other species are not present. Mature saltcedar is more drought-resistant than competing native shrubs and trees. (Stihler-Mass)

AVIAN USE OF SALTCEDAR COMMUNITIES IN THE LOWER COLORADO RIVER VALLEY,
Arizona State Univ., Tempe. Dept. of Zoology; and Arizona State Univ., Tempe. Center for Environmental Studies
B. W. Anderson, A. Higgins, and R. D. Ohmart.
In: Importance, Preservation and Management of Riparian Habitat: A Symposium, July 9, 1977, Tucson, Arizona, USDA Forest Service General Technical Report RM-43, p. 128-136, 11 tab, 1 ref

Descriptors: *Riparian land, *Birds, *Census, *Colorado River, Wetlands, Riparian plants, Trees, Cottonwoods, Willow trees, Mesquite, Nongame birds, Wildlife, Streams, Density, Saltcedar.

Bird densities and bird speicies diversities (BSD) is saltcedar (Tamarix chinesis) stands of the lower Colorado River Valley were determined on a seasonal basis from May 1974 through February 1977. Comparisons were made between six saltcedar structural types as well as on a community level with seven other vegetation types. A method of determining the relative value of the communities, as well as the saltcedar structural types, based on density, density with 10 percent doves, BDS, BDS with 10 percent doves, number of species, structural diversity, and size of census area is described. Results showed the saltcedar community supported fewer birds than native communities, although tall, dense stands were valuable for nesting doves and rarer bird speicies in riparian communities along the lower Colorado River. 3C. Use Of Water Of Impaired Quality

ROOT GROWTH ALONG PLEXIGLAS SURFACES BY SUGARCANE UNDER DIFFERENT SOIL SALINITY CONDITIONS,
Texas Agricultural Experiment Station, Vernon.
C. J. Gerard.
Agronomy Journal, Vol. 70, No. 4, p 639-643, July-August, 1978. 7 fig, 1 tab, 12 ref

Descriptors: *Root development, *Salinity, Moisture stress, Growth stages, Sugarcane, Plant growth, *Saline soils, Crop response, Saline water.

Root growth of sugarcane (Saccharum officinarum L.) in soils irrigated with waters with electrical conductivities of 1.1, 5.0, and 8.0 mmhos/cm varied with stage of plant growth, time and salinity treatments. Root growth was greatest at soil depths of 20 to 60 cm in May, June, and July, a period of high growth rate and high evaporative conditions. During these months, average root intensities of sugarcane, irrigated with waters with salinities of 1.1, 5.0, and 8.0 mmhos/cm, were about 0.5, 1.0, and 1.5 mm/sq cm, respectively. Moisture stress induced by osmotic potentials of about -1.8 and -2.9 bar and high evaporative conditions stimulated root intensities but reduced top growth by 22 and 50%, respectively. These studies using root chambers have contributed to a better understanding of the interactive influences of stages of plant growth, salinity, and environment on root growth of sugarcane. PLANNED WASTEWATER REUSE, A LITTLE-USED RESOURCE,
Municipal Environmental Research Lab., Cincinnati, OH
F. M. Middleton.
News of Environmental Research in Cincinnati, July 1977. 4 p, 1 fig, 1 tab, 7 ref

Descriptors: *Water reuse, *Water utilization, *Water conservation, Water shortage, Water supply, Public health, Economics, Cost analysis, Social impact, Federal Water Pollution Control Act, Safe Drinking Water Act, Municipal wastes, Recycling, Artificial recharge, Waste water treatment, Injection, Percolation.

Although water reuse has been practiced for a number of years in many areas, planned water reuse has become mandatory through the Federal Water Pollution Control Act Amendments of 1972 (PL 92-500) and the Safe Drinking Water Act of 1974. Activities related to water reuse by municipalities include long range plans for supplementing fresh supplies with renovated water, recharge to groundwater by injection or percolation of treated waste waters. In the water short areas of Dallas, Texas, and San Diego, California, it was found that providing 50% renovated water for these cities would cost 25% to 50% more than further development of natural supplies. This reuse will be necessary by early part of the next century, when more water supplies will be needed. A reuse potential check list is provided for communities to determine reuse feasibility by cost-effective analysis. Health effects of using renovated water and socio-economic considerations are discussed. It is concluded that Federal, state, and local authorities need to consider and begin programs incorporating reuse for the water resources of the nation. (Davison-IPA)

REUSE OF TREATED FRUIT PROCESSING. WASTEWATER IN A CANNERY,
Snokist Growers, Yakima, WA.
L. A. Esvelt.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 805, Price codes: A07 in paper copy, A01 in microfiche. Final Report No. EPA-600/2-78-203, September 1978. 124 p, 29 fig, 28 tab, 10 ref, 1 append. S803280.

Descriptors: *Water reuse, *Waste water treatment, *Industrial wastes, *Canneries, Reclaimed water, Biological treatment, Water purification, Biochemical oxygen demand, Chemical oxygen demand, Chlorination, Effluents, Filtration, Investigations, Feasibility studies, Economics.

The technical and economic feasibility of reusing treated cannery processing effluent for supplementing or replacing a portion of the raw water supply are examined. The study spanned two processing seasons during which reclamation of the biologically treated effluent by filtration through mixed media pressure filters and disinfection with chlorine was investigated. Trial uses of the reclaimed water included: (1) initial product conveying; (2) equipment, floor and gutter wash; (3) direct contact container cooling; (4) boiler feed. Steam from the reclaimed waste water was used for equipment cleaning, exhausting, cooking and blanching on a trial basis, and no degradation of the product resulted from this use. Results from this study, compared with a 1967-1968 evaluation, revealed that the biological treatment system performances were equivalent except that the present endogenous respiration rate of the biological sludge was lower. Lower emissions rates for flow, chemical oxygen demand and biochemical oxygen demand were shown during the earlier study due to more efficient in-plant controls. It is concluded that the biologically treated waste water can be reclaimed for reuse within the cannery except during periods of high suspended solids discharge from biological treatment. 3F. Conservation In Agriculture

QUANTITATIVE ESTIMATION OF LIVING WHEAT-ROOT LENGTHS IN SOIL CORES,
Agricultural Research Service, Pendleton, OR. Columbia Plateau Conservation Research Center.
K. J. Ward, B. Klepper, R. W. Rickman, and R. R. Allmaras.
Agronomy Journal, Vol. 70, No. 4, p 675-677, July-August, 1978. 4 tab, 5 ref.

Descriptors: *Root development, *Wheat, Dicots, Monocots, Sampling, *Soil cores.

A rapid, efficient method for separating living wheat (Triticum aestivum L.) roots from dead roots in field soil samples has been proposed. Combined techniques of separation, staining and length measurements were used to determine root density with an accuracy of plus or minus 9%. It was observed that most monocot roots stained more intensely than dicot roots, indicating that monocot-dicot root separation from the same root medium may facilitate studies of root competition. (Skogerboe-Colorado State)
W79-03514

INFLUENCE OF FERTILIZER AND RESIDUE MANAGEMENT ON GRASS SEED PRODUCTION,
Washington State Univ., Pullman. Dept. of Agronomy Soils.
C. L. Canode, and A. G. Law.
Agronomy Journal, Vol. 70, No. 4, p. 543-546, July-August, 1978. 3 tab, 8 ref.

Descriptors: *Grasses, Wheatgrass, Fescues, Bromegrass, *Fertilization, Burning, Air pollution.

The experiments were conducted on a silt loam soil (Pachi Ultic Haploxerolls) as a split-plot within each grass species. Main plots were three levels of 18-10-10-7 fertilizer applied to supply N at 90, 112, and 135 kg/ha, with an associated increase in P, K, and S. Main plots were split for open burning and two levels of mechanical residue removal. Two crops of red fescue and four seed crops of smooth bromegrass and crested wheatgrass were evaluated. Average seed yields (kg/ha) for burning compared with mechanical straw removal were 636 vs. 495 for red fescue, 1,122 vs. 848 for smooth bromegrass, and 872 vs. 790 for crested wheatgrass. Straw and stubble removal, compared with straw removal alone, increased seed yield of red fescue and smooth bromegrass, but decreased seed yield of crested wheatgrass. Interactions of fertilizer rates and residue management were not significant. The increase in seed production resulting from burning residue apparently was associated with control of downy bromegrass (Bromus tectorum L.) and increased vigor of autumn regrowth. (Skogerboe-Colorado State)

RELATIVE EVALUATION OF WATER STRESS INDICATORS FOR SOYBEANS,
International Crops Research Inst., Hyderabad (India). Semi-Arid Tropics.
M. V. K. Sivakumar, and R. H. Shaw.
Agronomy Journal, Vol. 70, No. 4, p. 619-623, July-August, 1978. 7 fig, 1 tab, 23 ref, 1 equ

Descriptors: *Soybeans, Soil-water-plant relationships, *Moisture stress, Moisture deficit, Growth rates, Plant growth, *Soil water, *Iowa, Indicators.

Field studies were conducted during 1976 on Ida silt loam (fine, silty, mixed (calcareous) mesic family of Typic Udorthents) at the Western Iowa Experimental Farm, Castana, Iowa, to evaluate three plant measurements (vis., stomatal conductance, leaf-water potential, and leaf area) as water stress indicators for soybeans (Glycine max (L.) Merr.). Daily means of stomatal conductance and leaf-water potential measured several times during the growing season were closely related to changes in soil-water potential. 'Rate of leaf-area expansion' which is defined as the change in average leaf area (leaf area/number of leaves) per plant over a period of time, also showed a close correspondence with soil-water potential. Relative growth rates of soybeans showed a negative correlation with stomatal conductance, leaf-water potential, and rate of leaf-area expansion. The three plant measurements should prove useful in explaining water-deficit effects quantitatively under field conditions. (Skogerboe-Colorado State)
W79-03521

ACCUMULATION AND REDISTRIBUTION PATTERN OF DRY MATTER AND N IN TRITICALE AND WHEAT VARIETIES UNDER WATER STRESS CONDITION,
California Univ., Davis. Dept. of Land, Air, and Water Resources.
P. Lal, G. G. Reddy, and M. S. Modi.
Agronomy Journal, Vol. 70, No. 4, p. 623-626, July-August, 1978. 1 fig, 3 tab, 16 ref.

Descriptors: *Cereal crops, *Wheat, Moisture stress, Varieties, *Nitrogen, Translocation, Economic efficiency, Moisture deficit, Crop production, Grains(Crops).

The objective of this study was to screen varieties of triticale (Triticale hexaploide Lar.) relative to wheat (Triticum aestivum L.) for their high translocation ability and N utilization efficiency. A field experiment was conducted on silt loam soil (Typic Hapludoll) during 1973-74 at Pantnagar, India. Treatments consisting of five varieties each of triticale and wheat were arranged in a randomized block design with five replications. Plant samples were collected from a 0.125-sq m area for dry matter and N content studies in culm, lower leaf, flag leaf, spike chaff, and grain at successive stages. The loss of dry matter from different plant parts was assumed to be translocated to the grains. Both triticale and wheat cultivars differed greatly in their capacity to accumulate and redistribute dry matter and N. On an average, triticale cultivars removed larger amounts of N than the wheat. (Skogerboe-Colorado State)
W79-03530

INFLUENCE OF MANURE APPLICATION RATES AND CONTINUOUS CORN ON SOIL-N,
Vermont Univ., Burlington. Dept. of Plant and Soil Science.
F. R. Magdoff.

The manure-N experiments with continuous corn (Zea mays L.) were conducted on both a somewhat poorly drained Panton clay (Typic Ochraqualf) and a well-drained Calais loam (Typic Fragiorthod). Manure rates of 0, 22, 44, and 66 metric tons/ha/year were combined in factorial arrangement with ammonium nitrate rates of 0, 112, and 224 kg N/ha/year. Comparison of calculated theoretical soil-N with experimentally determined levels after 5 years and the response of corn to fertilizer-N indicate that mineralization of manure organic-N, when applied to the Panton clay, was less than when applied to the Calais loam. Thus,

manure-N was less available to the growing crop on the clay and accumulated in the soil at a greater rate than in the loam. The annual manure application rates required to maintain initial soil N levels in Panton clay and Calais loam under continuous corn production were calculated to be 40 to 52 tons/ha respectively. Two mineralization models were examined: Model 1 assumed only the first year manure mineralization rate above native soil organic matter decomposition rate; Model 2 assumed a 5-year mineralization decay series. Both were effective in predicting final soil-N levels. (Skogerboe-Colorado State)

EFFECTS OF SOIL WATER STRESS ON GROWTH AND NUTRIENT ACCUMULATION IN CORN,
Kasetsart Univ., Bangkok (Thailand). Dept. of Soil Science.
V. Verasan, and R. E. Phillips
Agronomy Journal, Vol. 70, No. 4, p. 613-618, July-August, 1978. 6 fig, 10 ref.

Descriptors: *Moisture stress, *Moisture deficit, *Corn(Field), Plant growth, Nutrients, Plant physiology, Transpiration, *Moisture tension

The objective of this study was to more clearly delineate the effect of soil water stress on growth and accumulaton of nutrient ions in corn. Corn was grown in the greenhouse in 20-liter pots containing soil from the Ap horizon of Maury silt loam (Typic Paleudalfs) under two soil moisture treatments, stressed and nonstressed. The relationship soil was potential and cumulative evapotranspiration with nutrient accumulation and dry matter production were more significant than the relationship of soil water potential with dry matter production and nutrient accumulation. Since water stress affects turbidity, photosynthesis, respiration, cell enlargement, and other physiological processes of the plant, it was concluded that cumulative transpiration is a better integrator of the effects of these processes on plant growth than is soil water potential. EVALUATION OF PROTEIN AND NUTRITIVE FIBER CONTENT OF CULTIVATED RUSSIAN - THISTLE,
New Mexico Agricultural Experiment Station, University Park
D. A. Farmer, J. L. Fowler, and J. H. Hageman
Agronomy Journal, Vol. 68, p. 691-692, July-August 1976. 2 tab, 18 ref. OWRT A-049-NMEX(1).

Descriptors: *Forages, *Nutrient requirements, *Proteins, Fertilizer, Essential nutrients, Nitrogen compounds, Evaluation, Chemical analysis, *Russian-thistle, Amino acids, Natural use, Efficiencies

Nutritional parameters of Russian-thistle, Salsola sp., grown under controlled green house conditions, were measured. Various levels of nitrogen fertilizer were applied resulting in a protein content for the flowering plants of 19.8 - 3.6% for all levels of nitrogen application. Acid detergent ligin fiber values averaged 34.5 - 5.3%, ad acid detergent fiber values averaged 6.4 - 1.6%. No correlations were found between nitrogen application and total crude protein, acid detergent fiber, or acid detergent lignin. The amino acid composition of the total protein was nutritionally well balanced. These values are comparable to many commonly used forages. (Davison-IPA)

Descriptors: Energy, Water consumption, Water supply, Natural gas, Irrigated agriculture, Organic compounds, Pumping, *Energy costs, Groundwater, *Withdrawal, Texas Trans-Pecos, *Texas High Plains

Agriculture uses large quantities of energy to pump groundwater for irrigation. This means the cost of energy has important implications for the industry in terms of cost and profitability. Increases in the prices of energy sources such as natural gas, electricity, liquid petroleum gas and diesel can cause economic hardship for irrigators, particularly if those increases are unanticipated. The purpose of this paper is to briefly summarize important trends in the current domestic energy situation that could have significant impacts on the future cost and availability of energy, and to show what the implications of those trends are for irrigated agriculture. The primary focus is on trends in natural gas, since natural gas is the major fuel used for irrigation in the Great Plains states.

WATER COLLECTION INDICATOR DEVICE,
R. F. Cahill
U.S. Patent No. 4,119,056, 8 fig, 7 ref; Official Gazette of the United States Patent Office, Vol. 975, no 2, p 515, October 10, 1979.

Descriptors: *Patents, *Measurement, *Irrigation, Irrigation practices, Irrigation efficiency, Water levels, Water requirements, Water supply, Equipment

Some of the advantages of this invention are that the amount of irrigation water to be supplied to crops can be preselected, the actual water supplied to the crops can be measured, a signal is produced which is visible over long distances and from any direction. Rainfall can also be measured so that total irrigation watering can be limited to a desired amount. A water collection indicator device includes a cup-like collector for collecting water, a signal member telescoping relative to the collector, a bias spring forcing the signal member away from the collector, and an actuator pivotally supported in the collecting including an arm engaging the signal member to prevent movement of the signal member away from the collector and a float movable with rising water level in the collector to pivot the actuator and disengage the arm from the signal member whereby the bias spring will move the signal member away from the collector to produce a visual signal indicating collection of a predetermined amount of water. (Sinha - OEIS)
W79-03785

MOBILE AGRICULTURAL IRRIGATION APPARATUS,
H. Tidwell
U.S. Patent No. 4,119,272, 4 p, 3 fig, 6 ref; Official Gazette of the United States Patent Office, Vol. 975, no 2, p 589, October 10, 1978.

Descriptors: *Patents, *Irrigation, *Application equipment, Irrigation practices, Irrigation efficiency, Water conveyence, Self-propelled equipment, Irrigation boom.

A self-contained and self-propelled irrigation apparatus for row crops embodies a comparatively short closed end apertured irrigation boom which receives water through the tubular shaft of a hose reel mounted on the boom. The boom and hose reel are carried by a wheeled support which includes widely spaced traction wheels and a centrally stabilizing wheel. A platform on the boom mounts an engine and drive trains for the traction wheels and hose reel. (Sinha - OEIS)
W79-03786

FLUID SPRAY HEAD AND METHOD ADAPTED TO SPRAY SPECIFIC PATTERN,
Toro Co., San Marcos, CA. (Assignee)
E. J. Hunter
U.S. Patent No. 4,119,275, 8 p, 7 fig, 5 ref; Official Gazette of the United States Patent Office, Vol. 975, No. 2, p. 590, October 10, 1978.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, Irrigation practices, Irrigation efficiency, Sprays, Application equipment, Flow control

An improved fluid spray head for sprinkler apparatus is disclosed adjustable both as to the flow rate of fluid, the discharge surfaces and the precipitation rate over the ground area sprayed, and pa

ticularly adapted to spray a specifically shaped non-circular area. The spray head has circumferentially-spaced discharge orifices having cross-sectional areas equally proportional to the square of the distance that their respective spray streams are desired to travel whereby the perimeter of the ground area sprayed defines the preselected shape and receives a substantially uniform coverage of fluid. The spray head includes an inner tubular member which telescopes within an outer tubular member to provide the simultaneous adjustment of the size of the discharge orifices. The inner tubular member is made radially thinner so as to be more pressure expandable under fluid pressure to thereby tighten the fluid seal between the inner tubular member and the outer tubular member. Methods for constructing and operating a fluid spray head adapted to spraying a specific pattern or shaped area are also disclosed. (Sinha-OEIS)
W79-03787

CENTER PIVOT IRRIGATION APPARATUS,
L. D. Holtzen.
U.S. Patent No 4,120,454, 9 p, 7 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 975, No 3, p 994, October 17, 1978.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, Irrigation practices, Irrigation efficiency, Water control, Application equipment, Electrical equipment, Self-propelled equipment, Center pivot irrigation system.

An electrically controlled water powered reversible center pivot irrigation apparatus is disclosed. The apparatus includes water-carrying conduits flexibly connected to each other and supported at intervals by self-propelled supports. Each of the self-propelled supports includes a water powered sprinkler which turns a drive shaft for propulsion of the support. An electrically controlled transmission designates the direction in which the support travels and mechanical linkages, operable in either direction of movement of the apparatus, control the flow of water from the conduits to the sprinklers depending upon the relative position between adjacent conduits. RADIATION AND ENERGY BALANCE OF A TRICKLE-IRRIGATED LEMON GROVE,
Arizona Water Resources Research Center, Tucson.
J. Ben-Asher, and T. W. Sammis.
Agronomy Journal, Vol. 70, No. 4, p 568-572, July-August, 1978. 4 fig, 2 tab, 7 ref. OWRT B-035-ARIZ(8) and B-045-ARIZ(9).

Descriptors: Water conservation, Irrigation, *Irrigation systems, *Evapotranspiration, *Lemons, Albedo, *Radiation, *Energy budget, Trickle irrigation.

This study was conducted to evaluate the water saving potential and evapotranspiration from a trickle irrigated lemon grove (Citrus limon L. 'Lisbon'). Detailed measurements of global, reflected, and net radiation and its dissipation above the plant, the unshaded sandy soil, and the area as a whole were made in the spring and summer of 1975. Two sources of radiant energy were observed: net radiation which accounted for 70% of the energy utilized in evapotranspiration and reflected radiation from the unshaded soil accounting for 30%. Experimentally the net radiation and the evapotranspiration from the area as a whole decreased and vice versa. On the other hand, evapotranspiration and its ratio to evaporation from a class A pan were smaller than any previously reported values. Therefore, it is suggested that for these two periods the contribution of energy from the dry area to the wet did not reflect a specific disadvantage for trickle irrigation. NATIONAL CONFERENCE ON MANAGEMENT OF NITROGEN IN IRRIGATED AGRICULTURE.
For primary bibliographic entry see Field 5G.
W79-03941

THE INDISPENSABLE ROLE OF NITROGEN IN AGRICULTURAL PRODUCTION,
Nebraska Univ., Lincoln. Dept. of Agronomy.
R. A. Olson.
In: National Conference on Management of Nitrogen in Irrigated Agriculture, p 1-31, 1978. 10 fig, 2 tab, 35 ref.

Descriptors: *Nitrogen, *Fertilizers, Nutrients, *Crop production, Crop response, Pollutants.

The indispensable role of nitrogen in food and fiber production for the world's people cannot be disputed. There is no substitute for nitrogen in its essential roles as a component of the chlorophyll and protein constitutents of crop plants. The quantity required for obtaining an economic yield of most crops exceeds that of all other soil-derived essential nutrients. The advent of relatively cheap fertilizer nitrogen in the 1950's caused radical increases in yields obtainable with most crops in the developed countries and provided the spark that ignited the Green Revolution in many of the Less Developed Countries in the 1960's as well. Its preeminence in the food production chain notwithstanding, nitrogen has been subjected recently to more critical surveillance than any other element in agriculture by reason of energy expended in its conversion into fertilizers, its monetary cost to the farmer, and its potential role as environmental pollutant. The economic and environmental problems can be minimized, however, by matching rate and timing of applied nitrogen with the amount likely to be provided the soil during the growing season and with the water regime afforded. The agricultural sector must achieve this matching objective promptly if it is not to be condemned by the rest of society in the long term. (See also W79-03941) (Skogerboe-Colorado State)

REMOVAL OF NITROGEN BY VARIOUS IRRIGATED CROPS,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
T. C. Tucker, and R. D. Hauck.
In: National Conference on Management of Nitrogen in Irrigated Agriculture, p 135-167, 1978. 2 fig, 7 tab, 16 ref

Descriptors: *Nitrogen, *Nutrient removal, Crop production, Fertilizers, Soil management.

Harvested agronomic and horticultural plants, excluding rice, are grown under irrigation on over 16 million hectares of land in 33 states. The paper presents results of a survey of published and recent unpublished information on removal of soil and fertilizer nitrogen from irrigated land in the harvested portion of crops. The amount of nitrogen removed varied considerably among different plant species and within the same species when grown under widely different management and environmental conditions. The amount of fertilizer nitrogen apparently removed during harvest was greater for hay, silage, and pasture crops and least for certain vegetables, fruits, and nuts. The amounts of nitrogen removed by grain crops generally was within the average range for all crops, 40 to 60% of the nitrogen applied. Fertilizer efficiency is discussed from three main viewpoints in terms of (1) the amount of applied nitrogen found in the plant, (2) the yield of harvested plant parts in relation to amount of fertilizer nitrogen applied, and (3) the cash value of marketable crop in relation to nitrogen cost. Examples are given, using data for coastal bermudagrass and wheat, of fertilizer efficiency as calculated on the basis of these viewpoints. Methodological problems of collecting data and problems of data interpretation are discussed in relation to the several concepts of fertilizer efficiency, and emphasis is placed on the need to recognize the role of all soil, and crop management factors in determining the efficiency by which plants use nitrogen. VOLATILE LOSSES OF NITROGEN FROM SOIL,
California Univ., Davis. Dept. of Land, Air and Water Resources.
D. E. Rolston
In: National Conference on Management of Nitrogen in Irrigated Agriculture, p 169-193, 1978. 4 fig, 18 ref.

Descriptors: Denitrification, *Volatility, *Nitrogen, Fertilization, *Soils

Nitrogen may be lost from soil in the gaseous form by two major mechanisms, ammonia volatilization and denitrification. Ammonia gas may be lost to the atmosphere whenever ammonium compounds are applied to the soil surface. The greatest ammonia losses occur from calcareous soils at high soil pH. Fertilizers such as urea and ammonium sulfate result in greater ammonia loss than that from ammonium nitrate when applied to a moist soil surface. More than 50% of the applied fertilizer may be lost by ammonia volatilization if precautions are not taken. The best solution for minimizing ammonia loss is to incorporate or place ammonium compounds approximately 10 cm below relatively dry surface soil. The volatile products of denitrification, nitrous oxide and nitrogen gas, may be lost from the soil whenever the soil becomes wet enough that oxygen becomes depleted and sufficient carbon is available from organic materials to support microbial activity. Denitrification occurs significantly only over a very narrow soil-water content range near saturation and in those portions of the soil profile with fairly high organic material. Consequently, denitrification will generally only occur in the surface 60 cm of most soils of arid regions unless perched water tables exist at a buried surface horizon. Management practices to either minimize or maximize denitrification should be directed at controlling nitrate position and water content in the surface soil. EFFECT OF WATER MANAGEMENT ON NITRATE LEACHING,
California Univ., Riverside. Dept. of Soil and Ir-

vironmental Sciences
J. Letey, J. W. Biggar, L. H. Stolzy, and R. S. Ayers.
In: National Conference on Management of Nitrogen in Irrigated Agriculture, p 231-249, 1978. 4 fig, 3 tab.

Descriptors: *Nitrates, *Leaching, Water pollution, *Water management(Applied), *Nitrogen, Fertilization, Effluents, Correlation analysis

Nitrates which are leached (transported below the root zone) represent a resource loss and a potential contribution to water pollution. The amounts of leached nitrates for a given time period were determined at various commercial farming sites in California and in a carefully controlled experimental plot receiving various water and fertilizer application treatments. Some of the agricultural sites had tile drainage systems and others had 'free drainage' to the groundwater. Linear regression analyses were conducted on the data. Similar results were observed for the tile and free drainage systems. The highest correlation coefficient was achieved for the amount of leached nitrates versus the product of the drainage volume and fertilizer nitrogen application. The next highest correlation coefficient was for amount leached versus drainage volume followed by amount leached versus fertilizer nitrogen application. In most cases there was no significant correlation between nitrate concentration in the water below the root zone and drainage volume or fertilizer nitrogen application. A significant linear relationship between amount of leached nitrate and drainage volume was also obtained at the experimental plot. (See also W79-03941) (Skogerboe-Colorado State)

USE OF MATHEMATICAL RELATIONSHIPS TO DESCRIBE THE BEHAVIOR OF NITROGEN IN THE CROP ROOT ZONE,
Florida Univ., Gainesville. Dept. of Soil Science
J. M. Davidson, and P. S. C. Rao
In: National Conference on Management of Nitrogen in Irrigated Agriculture, p 291-319, 1978. 7 fig, 3 tab, 27 ref

Descriptors: *Nitrogen, Denitrification, *Root zone, Soil water movement, *Mathematical studies

A procedure to estimate the movement of water-soluble nitrogen species (NO_3 and NH_4) was developed by assuming that (1) the soil-water residing in all pore-sequences participates in the transport process, and the (2) the soil-water initially present in the soil profile was completely displaced ahead of the water entering at the soil surface. Field-capacity and initial soil-water content distribution in addition to total water inputs were necessary parameters to estimate solute transport in the root zone. First-order kinetics were assumed to describe the nitrogen transformations (mineralization, immobilization, nitrification, and denitrification). These transformation processes were considered to occur under ideal conditions. Plant uptake of water and nitrogen (nitrate and ammonium) was estimated, respectively, from potential evapotranspiration and nitrogen uptake rate under ideal environmental conditions for a given crop. Actual plant uptake of water and nitrogen was dependent upon the available soil water and total mineral nitrogen within the crop root zone. These mathematical relationships could be solved using a programmable desk-top calculator; however, a larger computer was needed when more complex submodels were employed to describe soil-water uptake. The proposed mathematical relationships can provide field managers and regulatory personnel with an integrated description of the behavior of nitrogen in the root zone during a crop growing season. DIAGNOSTIC TECHNIQUES USED TO IDENTIFY OPTIMUM LEVELS OF NITROGEN FERTILIZATION FOR IRRIGATED CROPS,
Oregon State Univ., Corvallis. Dept. of Soil Science
T. L. Jackson.
In: National Conference on Management of Nitrogen in Irrigated Agriculture, p 321-332, 1978. 27 ref.

Descriptors: *Nitrogen, *Fertilization, Irrigation water, Nitrates, Analytical techniques.

The nitrogen available for plant growth comes primarily from (1) the nitrogen released from soil humus and crop residues, (2) nitrogen added as commercial fertilizers and (3) residual inorganic nitrogen from previous growing seasons or previous crops. Irrigation insures adequate moisture and relatively uniform yields from year to year. Irrigation also makes feasible the application of fertilizer nitrogen during the growth of the crop and this provides the opportunity to use soil and plant analysis early in the crop season to assess nitrogen needs. Examples of the use of diagnostic techniques for estimating the fertilizer nitrogen required to supplement residual nitrogen levels and the capacity of the soil to release nitrogen are presented. 'INSTREAM FOW'-APPLICABILITY OF EXISTING METHODOLOGIES FOR ALASKAN WATERS,
Woodward-Clyde Consultants, Anchorage, AL.
A. G. Ott, and K. E. Tarbox
Final Report, Alaska Department of Fish and Game and Department of Natural Resources, August 1977. 70 p, 9 fig, 5 tab, 22 ref, 1 append

Descriptors: *Alaska, *Streamflow, *Rivers, *Methodology, *Hydrology, *Water demand, Legislation, Statutes, Regulation, Classification, Reviews, Discharge(Water), Fish, Biological communities, Seasonal, Aerial photography, Meandering streams, Braided streams, Straight streams.

To facilitate planning for an expected increase in water requirements in Alaska due to oil and gas development, transfer of public lands to private ownership, and hydroelectric projects, applicability of 11 methodologies for instream flow requirements for maintaining fish and wildlife was evaluated. It is concluded that, due to extreme seasonal flow variability of the streams, diversity of stream types, absense of a hydrological data base, and lack of sophisticated field studies, no single method reviewed is applicable. Recommendations: (1) In the absence of detailed field investigations, the Montana Method may be applied to mountainous, split, and single-channel meandering streams, provided that limited field testing in Alaska verifies the basic relationships of the method. (2) For streams with immediate water allocation problems, field investigations using methods of the U.S. Fish and Wildlife Service Instream Flow Group should be initiated, and these methods should be refined for ultimate use on other Alaskan stream systems. (3) For braided, split-channel, and incised streams, field investigations should be started to define hydrological and biological relationships relative to altered flow patterns. Other methods reviewed: U.S. Fish and Wildlife (Billings, Montana; Oregon; Washington; U.S. Forest Service; Idaho Fish and Game; Indicator Species; Trout Cover Rating System; Habitat Quality Rating; and Waters. OPTIMAL SEQUENCING FOR A MULTIPURPOSE WATER SUPPLY SYSTEM,
Banyaszati Kutato Intezet, Budapest (Hungary).
I. Bogardi, F. Szidarovszky, and L. Duckstein
Advances in Water Resources, Vol. 1, No. 5, p 275-284, 1978. 10 fig, 4 tab, 20 ref.

Descriptors: *Water resources development, *Water supply, *Multiple-purpose, *Optimization, *Economic efficiency, *Sequencing, *Cost minimization, Dynamic programming, Water requirements, Water shortage, Water allocation(Policy), Equations, Mathematical models, Systems analysis, Economic losses, Game-theoretical method, Non-linear programming, Planning.

The optimal sequencing of a multipurpose water supply system in the Hajduhatsag region of Hungary is determined using dynamic programming (DP). The goal function minimizes the present value of capital costs, operating costs, and economic losses due to water shortages. Future water requirements are considered to be random variables because of natural and forecasting uncertainties. The nonlinear optimization problem at each stage is equivalent to a readily solved game theoretical problem, the solution of which is straightforward. Sensitivity analysis performed with respect to economic losses, water requirements, and discount rate has shown that optimal development and sequencing depend largely on the economic losses and the discount rate. WATER RESOURCES CONTROL THROUGH SYSTEMS ANALYSIS,
International Inst. for Applied Systems Analysis, Laxenburg (Austria).
D. R. Maidment.
Water Supply and Management, Vol. 2, No. 3, p. 243-251, 1978. 34 ref.

Descriptors: *Water resources, *Control, *Systems analysis, *Short-term operation, *Long-term operation, Water allocation(Policy), Floods, Simulation analysis, Data collections, Optimization, Reservoir operation, River basins, Operating policy.

Systems analysis can be applied to short-term and long-term operation and control of water resources systems. Short-term operation over hours or days is concerned with transient phenomena such as floods, and requires operating policies which are being continuously updated as new measured information is received. Long-term operation over months or years is concerned with allocation of water among competing users, taking account of possible shortages of water supply due to droughts. Systems analysis application procedures which develop appropriate operating policies are described together with some experiences gained in the implementation of these procedures in various countries. Topics requiring further applied systems analysis are identified. (Bell-Cornell)

Descriptors: *River systems, *Navigation, *Data collections, *Demographic factors, *Economic development, *Public sectors, *Projects, Agriculture, Recreation, Industries, Transportation, Harbors, Population, Employment, Natural resources, Public policy.

This report brings together data and a description of demographic, economic development, and public sectors which identify current conditions in the area of the McClellan-Kerr Arkansas River Navigation System for the years 1971-1974. Discussed are natural resources, transportation and port development, industrial development, agricultural development, recreation developments, public policy response, opportunities and problems, and population, employment and income. The project includes the navigation channel extending from the Mississippi River to Catoosa, Oklahoma and the three major upstream lakes which were originally authorized in the navigation plan, costing over $1.2 billion. The primary impact area described herein includes 28 counties bordering the waterway and the three upstream lakes. (Bell-Cornell)

A dynamic programming model is developed that finds the optimal allocation of land uses to maximize economic rent to land net of flood damage. The model specifically considers the impact of upstream development on downstream flood levels and the impact of flood-plain development on the amount of damage for given flood levels. An efficient, but elementary, routing procedure is developed to meet the requirements of the dynamic programming model. The model is demonstrated on realistic data for a watershed with 42 subbasins and eight land-use categories. This test problem is solved in several trials, each requiring about 30 seconds of computing time. The solutions appear to be stable despite the artificial discretization of flood flows. The model is useful for exploring the relationships among land use decisions and flood damages and for identifying target land use patterns for particular watersheds. (Bell-Cornell)

ENGINEERING SOLUTIONS TO BAY AREA DROUGHT CONDITIONS,
East Bay Municipal Utility District, Oakland, CA.
D. G. Larkin.
Journal of the Water Resources Planning and Management Division, Proceedings of the America Society of Civil Engineers, Vol 104, No WR1, p 235-251, November 1978. 7 fig.

Descriptors: *Droughts, *Water deprivation, *Water conservation, Water quality, Standards, Pipe joints, Emergencies, Interconnected systems, Water supply, California, *San Francisco Bay Area, Water agencies, Water plans, Agreements.

California underwent a 2 year drought from 1976 to 1978 which had a serious effect on all water supplies in the State. In the San Francisco Bay Area, several local water agencies, in conjunction with Federal and State agencies, developed complex multi-party agreements of mutual aid to alleviate the drought emergency. In record time of only a month from conceptual plan to startup, drought-relief water was provided to the local agencies in need. Three formal agreements among the several parties were developed with minimum red tape because the engineering staffs of the agencies involved realized the urgency of the situation. This attitude prevailed in the planning and design, as well as in the construction contract. The facilities constructed provided both supplemental water and high quality dilution water, and the effects of the drought were minimized. (Bell-Cornell)

POWER DEVELOPMENT AND WATER ALLOCATION IN OHIO RIVER BASIN,
Illinois Univ. at Urbana Champaign. Dept. of Civil Engineering.
R. W. Fuessle, R. M. Lyon, E. D. Brill, Jr., G. E Stout, and K. E. Wojnarowski.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 104, No WR1, p 193-209, November 1978. 3 fig, 8 tab, 35 ref.

Descriptors: *Cooling towers, *Planning, *Ohio River, *Water supply, *Thermoelectric power generation, *Water consumption, Water utilization, Irrigation, Municipal water, Industrial water, Plant siting, River basins, *Water allocation(Policy)

Widespread adoption of evaporative cooling towers will significantly increase water consumption by powerplants over the coming decades. The analysis presented includes consideration of allocation issues associated with other growing competitive uses: (1) municipal; (2) industrial; (3) irrigation; and (4) in-stream uses. Given hypothetical plant siting strategies suggested by the initial work of the Ohio River Basin Energy Study, consumption will represent high percentages of flows in the tributary basins of the lower Ohio River Basin, especially during 7-day, 10-year low-flow conditions. Consumption levels are shown for tributary river basins in Illinois, Indiana, Ohio, and Kentucky. Alternatives to high levels of consumption are suggested. In addition to presenting an analysis of water allocation in the Ohio Basin, this paper suggests a useful framework for analyzing water allocation in other regions. (Bell-Cornell)

ON THE THEORY AND MODELING OF DYNAMIC PROGRAMMING WITH APPLICATIONS IN RESERVOIR OPERATION,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources
M. Sniedovich.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 586, Price codes: A06 in paper copy, A01 in microfiche. Ph.D. Dissertation, December, 1976. 112 p, 1 tab, 30 ref, 2 append (University of Arizona Reports on Natural Resource Systems No 27) OWRT B-043-ARIZ(23), 14-31-0001-5056.

Descriptors: *Dynamic programming, *Algorithms, *Model studies, *Reservoir operations, *Optimization, *Decision making, *Reservoir stages, Time series analysis, Computer models, Computer programs.

The validity of the principle of optimality and the dynamic programming algorithm in the context of discrete time and state multistage decision processes is discussed. The multistage decision model developed for the purpose of the investigation is of a general structure, especially as far as the reward function is concerned. The validity of the dynamic programming algorithm as a solution method is investigated and results are obtained for a rather wide class of decision processes. The intimate relationship between the principle and the algorithm is

investigated and certain important conclusions are derived. In addition to the theoretical considerations involved in the implementation of the dynamic programming algorithm, some modeling and computational aspects are also investigated. It is demonstrated that the multistate decision model and the dynamic programming algorithm as defined in this study provide a solid framework for handling a wide class of multistage decision processes. The flexibility of the dynamic programming algorithm as a solution procedure for nonroutine reservoir control problems is demonstrated by two examples, one of which is a reliability problem. Many of the theoretical derivations presented especially those concerning the relation between the principle of optimality and the dynamic programming algorithm, are novel.

HEAT STORAGE WELLS: KEY TO LARGE-SCALE COGENERATION.
General Electric Co., Santa Barbara, CA. Center for Advanced Studies.
C. F. Meyer.
Public Power, p. 28-30, July-August 1977. 1 fig. OWRT C-5205(No. 4210)(7), C-6265(No. 5223)(16).

Descriptors: *Injection wells, *Aquifers, *Power system operation, *Heating, Heat exchangers, Aquifer systems, Water storage, Thermal capacity, Heated water, Heat transfer, Electric power production, Powerplants, Thermal powerplants, Utilities, Industries, Cities.

The concept of heat storage wells as adjuncts to total energy (cogeneration) systems is discussed. Groundwater pumped from a well drilled into a confined saline aquifer passes through a heat exchanger and is injected into another nearby well, the 'hot well', in the same aquifer. When heat is to be used, the water is pumped from the hot well through the heat exchanger, where the heat is removed, and then the water is injected into the warm well which has a higher temperature than the native groundwater. The hydrostatic pressure within the aquifer can maintain water as liquid at temperatures of 350F. The aquifer material is warmed by the flow of injected water through the aquifer pores; heat-recovery efficiency increases during successive cycles. The capital cost of wells, the heat exchanger, pumps and auxiliaries is estimated at $350,000 to $750,000 for a 20 mw (thermal) module. Costs of building this system on land, rather than drilling wells, are prohibitive. Experience with the 500 to 600 cogeneration systems in the U.S. shows a 25 to 35% energy savings can be achieved. The existing systems utilize small-scale heat storage. Studies indicate that large-scale cogeneration will come about only through securing a utility charter or involving an existing utility. District heating in Europe, and potential implementation of cogeneration systems by municipalities are discussed. (Davison-IPA)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-248 789. Price codes: E00 in paper copy, A01 in microfiche. Report TT 70-57765, Indian National Scientific Documentation Centre, New Delhi (India), 1975. 1033 p, 275 fig, 88 tab, 42 ref. Maximov, V. B., Editor.

Descriptors: *Canada, *Publications, *Hydrogeology, *Groundwater, Foreign countries, Foreign research, Methodology, Application methods, Technology, Engineering, Engineering education, Education, Schools(Education), Training, Investigations, Agriculture, Aquifers, Springs, Aquifer characteristics, Hydrologic cycle, *USSR.

The handbook was published in two volumes. The first volume provided information about general and special hydrogeology, principles of dynamics of groundwaters, and the problems of [illegible] groundwater in agriculture. The second edition dealt with the methods of investigations to be used in hydrogeology and described the means and modes for conducting the hydrogeological studies. The handbook was meant for engineers, technician-hydrogeologists, and other specialists engaged in hydrogeological studies and also for students and teachers of higher educational institutions and technical schools of corresponding specialities. ANALYTICAL STUDY OF THE OGALLALA AQUIFER IN LYNN AND GRAZA COUNTIES, TEXAS, PROJECTIONS OF SATURATED THICKNESS, VOLUME OF WATER IN STORAGE, PUMPAGE RATES, PUMPING LIFTS, AND WELL YIELDS.
Texas Dept. of Water Resources, Austin.
A. E. Bell and S. Morrison.
Report 223, September 1978. 68 p, 18 tab, 71 ref, 24 map.

Descriptors: *Groundwater resources, *Texas, *Aquifers, *Data collections, Groundwater, Maps, Water resources, Aquifer characteristics, Groundwater recharge, Water supply, Groundwater availability, Groundwater mining, Overdraft, Pumping, Projections, Saturated flow, Water wells, Lynn County(Texas), Garza County(Texas), *Ogallala aquifer(Texas), Pumpage rates, Pumping lifts, Well yields.

This is one of numerous planed county studies covering the declining groundwater resource of the Ogallala aquifer in the High Plains of Texas. The report contained maps, charts and tabulations which reflect estimates of the volume of water in storage in the Ogallala aquifer in Lynn and Garza Counties and the projected depletion of this water supply by decade periods through the year 2020. The report also contained estimates of pumpage, pumping lifts, and other data related to current and future water use in the counties. However, the report does not attempt to project that portion of the volume of the water in underground storage which may be ultimately recoverable. The Ogallala aquifer in Lynn and Garza Counties contained approximately 2.4 million acre-feet of water in 1974. Historical pumpage has exceeded 120,000 acre-feet annually, which is more than twice the rate of natural recharge to the aquifer in the counties. This overdraft is expected to continue, ultimately resulting in reduced well yields, reduced acreage irrigated, and reduced agricultural production. (Humphreys-ISWS)

CHARACTERISTICS OF PUMPING TESTS CONDUCTED IN HETEROGENEOUS CLASTIC SEDIMENTS OF THE EDMONTON AREA, ALBERTA,
Alberta Research Council, Edmonton. Groundwater Div.
R. Bibby.
In: Contributions to the Hydrogeology of Alberta, Bulletin 35, Alberta Research Council, Edmonton, p 31-39, 1977. 8 fig, 1 tab, 3 ref.

Descriptors: *Pumping, *Drawdown, *Groundwater, *Transmissivity, Curves, Aquifers, Wells, Water wells, Discharge(Water), Sedimentary structures, Sedimentary rocks, Geology, Data processing, Classification, Hydrology, Hydrogeology, *Alberta(Canada), Drawdown curves.

Drawdown curves of pumping tests conducted on 122 wells in the heterogeneous, clastic sediments of the Edmonton area were classified on the basis of their shapes when plotted on a semilogarithmic scale. Four basic shapes were recognized. These shapes, in general, do not conform to any theoretically predicted drawdown curves, and no completely acceptable explanation is known to account for their shape. The last straightline slope of the drawdown curves (and therefore the short-term transmissive capacity as calculated by Jacob's equation) was shown to have a long-normal probability distribution. This is of considerable significance when drawdown curves are used for predictive purposes. (See also W79-03819)(Sims-ISWS)

PUBLIC GROUNDWATER SUPPLIES IN HENDERSON COUNTY,
Illinois State Water Survey, Urbana.
D. M. Woller, and E. W. Sanderson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 780, Price codes: A02 in paper copy, A01 in microfiche. Bulletin 60-23, 1978. 20 p, 2 fig.

Descriptors: *Water supply, *Illinois, *Groundwater resources, *Well data, Unconsolidated aquifers, Gravels, Sand aquifers, Bedrock, Sandstones, Dolomite, Groundwater availability, Groundwater, Water sources, Water quality, Water wells, Data collections, Municipal water, Water yield, Water properties, Hardness(Water), Chemical properties, Deep wells, Shallow wells, Geology, Aquifers, Drillers logs, Henderson County(IL), Dissolved minerals, Water bearing formations.

All available information on production wells used for public groundwater supplies in Henderson County, Illinois, was presented. The definition of public water supply as contained in the Environmental Protection Act of 1970 was used to determine those water systems and wells to be included. The report included separate descriptions for groundwater supplies of 6 municipalities and 1 state park. These were preceded by brief summaries of the groundwater geology of the county and the development of groundwater sources for public use. Individual production wells for each supply were described in the order of their construction. The description for each well included the aquifer or aquifers tapped, date drilled, depth, driller, legal location, elevation in feet above mean sea level, log, construction features, yield, pumping equipment, and chemical analysis. WILDLIFE CONFLICTS IN RIPARIAN MANAGEMENT: GRAZING,
Coronado National Forest, Tuscon, AZ.
C. R. Ames.
In: Importance, Preservation and Management of Riparian Habitat: A Symposium, July 9, 1977, Tuscon, Arizona, USDA Forest Service General Technical Report RM-43, p.49-51. 6 fig.

Descriptors: *Riparian land, *Riparian plants, *Grazing, *Cattle, Effects, Wetlands, Southwest U.S., Arizona, Livestock, Eutrophication.

Because of its high moisture content, riparian forage is highly palatable to cattle; and, availability of water and shade in riparian areas provide a strong influence for livestock to frequent such areas. Protection of riparian habitat from the negative effects of grazing can only be effectively achieved through fencing. (Stihler-Mass)

SOME EFFECTS OF A CAMPGROUND ON BREEDING BIRDS IN ARIZONA,
Museum of Northern Arizona, Inc., Flagstaff.
S. W. Aitchison.
In: Importance, Preservation and Management of Riparian Habitat: A Symposium, July 9, 1977, Tuscon, Arizona, USDA Forest Service General Technical Report RM-43, p. 175-182. 1 fig, 5 tab, 31 ref

Descriptors: *Recreation, *Camp sites, *Birds, *Effects, *Arizona, Vegetation, Riparian land, Trees, Wildlife, Habitats, Camping, Wetlands, Streams.

Over a three-year period, breeding bird densities were found to be similar between a constructed campground and a relatively natural area when the campground was closed to campers. However, bird species composition differed between sites, the campground having relatively heavier bodied birds (x = 48.5 g) than the control area (x = 38.2 g). Once the campground was opened for human use, the breeding bird population decreased in density and diversity. On the control site the population either remained the same or increased. Locations for new campgrounds should be carefully scrutinized in terms of usage by wildlife; riparian habitats are important to birds and further destruction of this habitat in the Southwest neds to be discouraged. Descriptors: Environmental effects, *Monitoring, *Air pollution, *Water pollution, Thermal pollution, Powerplants, Analytical techniques, *Remote sensing, Reflectance, Photometry, Surveys.

This study attempts to define, develop and demonstrate the capabilities of remote sensing for monitoring the effects of stack emissions and thermal discharge on the environment The extent to which the reflectance properties of elements in the environment as measured from aerial photography could be related to the condition of the environment was examined. Program results indicated that vegetative stress in a forested environment can be related to reflectance signatures as measured from aerial imagery. In water quality studies, relationships between reflectance and chlorophyll concentration, suspended material and yellowing organics were shown. Data collected from aerial and boat measurements and combined with laboratory modeling showed that measurement of certain effects of thermal discharges on the aquatic environment is possible. POLAROGRAPHIC DETERMINATION OF LEAD HYDROXIDE FORMATION CONSTANTS AT LOW IONIC STRENGTH,
Geological Survey, Menlo Park, CA. Water Resources Div
C J Lind
Environmental Science and Technology, Vol 12, No 13, p 1406-1410, December 1978 2 fig, 4 tab, 15 ref

Descriptors: *Lead, *Polarographic analysis, *Freshwater, *Chemical reactions, *Ions, *Aqueous solutions, Chelation, Analytical techniques, Water chemistry, Heavy metals, Trace elements, Pollutants, Graphical methods, Evaluation, *Metal hydroxides, Molecular concentrations, Formation constants.

Values for the formation constants for lead hydroxide complexes containing one, two, and three hydroxide ligands have been determined at 0.01 M ionic strength. These constants can be directly applied to many freshwaters. Generally, however, applications should involve use of the constants corrected to zero ionic strength by using appropriate activity coefficients corresponding to the ionic strength of the solution being considered. In this connection, the steam distillation procedure has been applied for the determination of methyl mercury in fish and shells by gas-liquid chromatography. The procedure adapted herein involves steam distilling volatile alkyl mercurials as mercuric chlorides. The mercuric chlorides in the distillate are extracted with benzene, and the benzene phase is partitioned with a cysteine acetate solution. Methyl mercuric chloride in the aqueous phase is determined by electron capture gas-liquid chromatography using alpha-chloronaphthalene as an internal standard. (EIS-Deal)

CADMIUM AND ZINC IN MUSCLE OF BLUEGILL (LEPOMIS MACROCHIRUS) AND LARGEMOUTH BASS (MICROPTERUS SALMOIDES) FROM AN INDUSTRIALLY CONTAMINATED LAKE,
Purdue Univ., Lafayette, IN. Dept. of Bionucleonics
B R Murphy, G J Atchison, and A W McIntosh.
Environmental Pollution, Vol. 17, p. 253-257, 1978. 3 tab, 18 ref.

Descriptors: *Cadmium, *Zinc, *Sunfishes, *Bass, Pollutant identification, Chemical analysis, Heavy metals, Metals, Water chemistry, Public health, Human pathology, Food habits, Fish food organisms, Fish physiology, Animal metabolsm, Industrial wastes, Chemical wastes, Water analysis, Indiana, Palestine Lake, *Tissue analysis, *Bioaccumulation

Cadmium and zinc analyses of 44 largemouth bass and 29 bluegill indicate that fish in an ecosystem heavily contaminated by trace metals accumulate significantly more metal in edible muscle tissue than do fish in an uncontaminated ecosystem. Concentrations detected ranged from 0.010 to 1.308 ppm Cd and 18.2 to 158.2 ppm Zn (dry weight) Blugill contained significantly greater concentration of Cd and Zn than did bass and small bass contained significantly more Cd than did large bass. Human consumption of these fish is probably not a health hazard unless such fish constitute a major protion of the diet. (EIS-Deal)

THE SELECTION AND LIMITATIONS PHENOL AS A REFERENCE TOXICANT DETECT DIFFERENCES IN SENSITIVI AMONG GROUPS OF RAINBOW TRO (SALMO GAIRDNERI),
Fisheries and Marine Service, Winnipeg (Mani ba). Freshwater Inst
D G. Alexander, and R. Mc. V. Clarke
Water Research, Vol. 12, p 1085-1090, 1978. 3 t 17 ref

Descriptors: *Phenols, *Rainbow trout, *Bioass Analytical techniques, Laboratory tests, F physiology, Animal metabolism, Sodium co pounds, Copper sulfate, Sulfates, Chlorine, To ity, Mortality, Resistance, Fish behavior, Fish p ulations, *Reference toxicants.

Phenol was better than sodium azide, sodium p tachlorophenate, copper sulphate and dodecy dium sulphate in detecting differences in sensiti among groups of rainbow trout. Phenol detec differences in sensitivity among strains of trout could discern the effects of starvation, temp ture, stress and pre-exposure to 0.04 mg/l-1 c rine on the sensitivity of trout to phenol, but the effects of three brands of food and high mo ity during holding. The sensitivity of rainbow t to phenol was independent of weight and loa density in the bioassays. The use of phenol reference toxicant for the rapid detection of di ences in sensitivity among groups of fish is lim because differences can only be detected by c paring the sensitivity of an unknown group of to that of a known, unstressed group of fish in same bioassay. The concept of a single refere toxicant appropriate for bioassays with a variet chemicals is questionable because differe among groups of fish, which are detectable reference toxicant, may not affect the result bioassays with other chemicals. A series of phy logical and behavioural screening tests and nostic health checks may be more useful reference toxicants to identify groups of fish w should not be used in bioassays. (EIS-Deal)

BENTHIC MACROINVERTEBRATE COM NITIES OF THE PENOBSCOT RIVER, MA WITH SPECIAL REFERENCE TO TH ROLE AS WATER QUALITY INDICATORS,
Maine Univ. at Orono
C F Rabeni
Available from the National Technical Informa Service, Springfield, VA 22161 as PB-290 Price codes: A08 in paper copy, A01 in microfi PhD Thesis, January 1977 169p, 15 fig, 7 ta ref, 7 append OWRT A-028-ME(2)

Descriptors: *Bioindicators, Invertebrates, A sis, Classification, Current velocity, Detritus,

solved oxygen, Invertebrates, Pulp and paper effluents, Rivers, Sampling, Standing crops, Trbidity, Water chemistry, Water quality, Water temperature, *Maine, Pollutant identification, *Penobscot River(ME), *Benthic macroinvertebrates, Bray-Curtis ordination, Hess sampler, Pollution-stressed/clean water communities, Siltation, Water depth.

This study was designed to develop a system for using benthic macroinvertebrates as water quality indicators in a large deep river. Project objectives were: (1) to develop reliable sampling techniques; (2) to determine whether pollution-stressed communities were predictively differently from clean water communities; and (3) to determine the range of, and environmental factors responsible for, variations in the structures of clean water communities. Two sampling methods were of value--(1) a modified Hess sampler which obtained a more representative sample of actual standing crop, and (2) rock-filled baskets secured to the river bottom, which collected a greater number of individuals and taxa. Indicator organisms were not particularly sensitive, and species diversity was often misleading. An efficient water quality classification system was developed using the Bray-Curtis ordiantion, which was sensitive to changes in the faunal community structure caused by pulp and paper mill effluents. Invertebrates were better indicators of certain types of pollution than were standard physical and chemical methods. Analysis also indicated that the composition of clean water invertebrate communities were partially determined by current velocity, siltation, and organic detritus, and was not affected by water temperature, turbidity, dissolved oxygen, water depth, and water chemistry.

EFFECTS OF TRACE ELEMENTS ON NITRIFICATION IN SOILS,
Iowa State Univ., Ames. Dept. of Agronomy.
C. N. Liang, and M. A. Tabatabai.
Journal of Environmental Quality, Vol. 7, No. 2, p. 291-293, April-June, 1978. 3 tab, 15 ref.

Descriptors: *Nitrification, Inhibitors, Nitrates, Nitrites, *Trace elements, *Heavy metals, Pollutants.

Studies to evaluate the effects on nitrification of 19 trace elements showed that all these elements inhibited nitrification of NH4(+)-N added to soils. Results showed that the relative effectiveness of the trace elements in inhibition of nitrification depends on the soils. When the trace elements were compared to using 5 micromoles/g of soil, Ag(I), Hg(II), Cd(II), As(III), Cr(III), B(III), Al(III), Se(IV), and Mo(VI) were the most effective inhibitors (average inhibition less than 50 percent), and Mn(II) and Pb(II) the least effective (average inhibition greater than 25 percent) inhibitors. The average inhibition by the elements Co(II), Cu(II), Sn(II), Fe(II), Zn(II), Fe(III), V(IV), and W(VI) ranged from 33 percent with W(VI) to 49 percent with Fe(III). Silver(I), Ni(II), Co(II), Zn(II), Mn(II), Pb(II), As(III), B(III), Fe(III), As(V), Mo(VI), and W(VI) inhibited Nitrobacter, causing accumulation of NO2(-)-N in one of the soils used. (Skogerboe-Colorado State)

PHYTOPLANKTON NITROGEN METABOLISM, NITROGEN BUDGETS, AND OBSERVATIONS ON COPPER TOXICITY: CONTROLLED ECOSYSTEM POLLUTION EXPERIMENT,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
W. G. Harrison, R. W. Eppley, and E. H. Renger.
Bulletin of Marine Science, Vol 27(1). p 44-57, 1977. 9 tab, 6 fig, 40 ref.

Descriptors: *Phytoplankton, *Nitrogen, *Growth rates, *Copper, *Heavy metals, *Photosynthesis, Toxicity, Mortality, Water pollution effects, Path of pollutants, Resistance, Bioassay, *Plant growth, Plant physiology, On-site-investigation, Metabolism, *Controlled experimental ecosystem, *Nitrogen metabolism, Nitrogen budgets, Noctiluca sp, Nitrate reductase assays, *Nutrient loading.

Phytoplankton growth and nitrogen metabolism seemed typical of coastal temperate plankton in the 0.25-scale CEPEX enclosures used at Saanich Inlet, B.C., in the summer of 1974. Maximum rates of nitrogen assimilation corresponded to a growth rate of about 1.0 day-1 and half-saturation rates on a day-to-day basis were regulated primarily by ambient nitrate and ammonium levels, overall phytoplankton levels and settlement rates were related to the rate of nutrient loading. Remineralization of nitrogen to ammonium was rapid and important. Although only nitrate (along with phosphate and silicate nutrients) were added to the enclosures, rates of ammonium assimilation by the phytoplankton were similar to those for nitrate. Several actute effects of copper on phytoplankton were observed, including inhibition of nitrate uptake, photosynthetic carbon assimilation, synthesis of nitrate reductase, and cell disruption and loss of accumulated ammonium in Noctiluca sp. Evidence suggests that the addition of copper to the enclosures resulted in acute inhibition of phytoplankton growth and replacement of the initial phytoplankton by a copper-tolerant assemblage. Bioassay experiments indicated that even after the shift to copper-tolerant forms, (1) the copper in the enclosures remained in a chemical form still toxic to phytoplankton from control enclosures, and (2) the degree of copper-tolerance of the phytoplankton was related to ambient copper concentrations. (Katz)

DETERMINATION OF PHOSPHATE BY CATHODIC STRIPPING CHRONOPOTENTIOMETRY AT A COPPER ELECTRODE,
Southern Illinois Univ., Carbondale. Dept. of Chemistry and Biochemistry.
G. L. Lundquist, and J. A. Cox.
Analytical Chemistry, Vol. 46, No. 3, p. 360-364, March 1974, 4 fig, 4 tab. OWRR A-041-ILL(2), USDI 14-31-0001-3213.

Descriptors: *Phosphates, *Trace elements, *Electrodes, *Electrochemistry, *Pollutant identification, Electriochemical stripping, Electrolysis potential, Copper electrode.

A method for the determination of phosphate based upon stripping of an electrochemically deposited cupric phosphate film has been developed. The film consists of a mixture of Cu(II) salts of the conjugate bases of H3PO4 with the HPO 4(2-) salt being the major component in the analytical pH range. Linear working curves over single orders-of-magnitude down to 20 ppb phosphate have been obtained. The percent standard deviation varies from 20% to 20 ppb to within 3% at concentrations above 1 ppm. The detection limit is 10 ppb when a 20-minute electrolysis is used. Chemical dissolution of the film in competition with electrochemical stripping and the appearance of a blank transition due to reduction of cupric ion in the reaction layer establish the detection limit.
W79-03769

VOLTAMMETRIC DETERMINATION OF TRACE QUANTITIES OF NITRATE IN AN ANION EXCHANGE MEMBRANE ISOLATED CELL,
Southern Illinois Univ., Carbondale. Dept. of Chemistry and Biochemistry.
G. L. Lundquist, G. Washinger, and J. A. Cox.
4-31-0001-3213.

Descriptors: *Nitrates, Analytical techniques, *Volumetric analysis, Membranes(Anion exchange), *Pollutant identification, Water analysis, Electrolysis, Electrolytes.

Polarographic and spectrophotometric methods for the determination of trace quantities of nitrate have significant limitations for field investigations. The proposed method is based upon the reduction of nitrate by linear potential scan voltammetry at a stationary mercury drop electrode in a small volume electrolysis cell. The cell is isolated from the test solution by an anion exchange membrane. The membrane serves to preconcentrate the nitrate in the electrolysis chamber and also prevents net loss of the supporting electrolyte from the chamber. Hence, a dip-type system may be designed for direct voltammetric measurements in low ionic strength media. Experimental results demonstrate that linear scan voltammetry determinations in samples of low-to-moderate ionic strength. Surfactants, chloride and cations do not interfer which makes the method attractive for natural water samples.

WATER SYSTEM VIRUS DETECTION,
National Aeronautics and Space Administration Washington, DC. (Assignee).
J. C. Fletcher, A. S. Fraser, A. F. Wells, and H. J. Tenoso.
U.S. Patent No. 4,118,315, 7 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol. 975, No. 1, p. 258, October 3, 1978.

Descriptors: *Patents, *Monitoring, *On-site tests, *Water quality control, Recirculated water, Reclaimed water, Water reuse, Viruses, Performance, Pollutant identification.

In a closed environment system, such as exists in a spacecraft, it is necessary to recycle waste products to the maximum extent. Water is a particular commodity which must be recycled. The object of this invention is to monitor the performance of a waste water reclamation system whereby early detection of any system malfunction is obtained. The performance is monitored by introducing a non-pathogenic marker virus, bacteriophage F2, into the waste-water prior to treatment and, thereafter, testing the reclaimed water for the presence of the marker virus. A test sample is first concentrated by absorbing any marker virus onto a cellulose acetate filter in the presence of a trivalent cation at low pH and then flushing the filter with a limited quantity of a glycine buffer solution to desorb any marker virus present on the filter. Photo-optical detection of indirect passive immune agglutination by polystyrene beads indicates the performance of the water reclamation system in removing the marker virus. A closed system provides for concentrating any marker virus, initiating and monitoring the passive immune agglutination reaction, and then flushing the system to prepare for another sample. Peristaltic pumps are provided for volumetric control and for positive fluid displacement. Solenoid valves direct the output from the pumps in preselected routes to accomplish the process for concentrating and detecting the marker virus. (Sinha-OEIS)

SCENARIO FOR AN ONGOING CHLOROPHYLL A SURVEILLANCE PLAN ON LAKE ONTARIO FOR NON-INTENSIVE SAMPLING YEARS,
Canada Centre for Inland Waters, Burlington (Ontario).

R. E. Kwiatkowski.
Journal of Great Lakes Research, Vol. 4, No. 1, p 19-26, March 1978. 4 fig, 3 tab, 21 ref.

Descriptors: *Sampling, *Canada, *Chlorophyll, *Lake Ontario, Surveys, Data collections, On-site investigations, Data processing, Statistics, Seasonal, Distribution patterns, Lakes, Nutrients, Water quality.

This study proposed an effective, non-intensive sampling program for chlorophyll a on Lake Ontario. Three years of chlorophyll data were used to establish three statistically homogeneous zones, significantly different at the 5% level. These zones were referred to as offshore, inshore, and point source areas. The seasonal cycle for each zone was presented as was the number of samples needed to estimate the mean of each zone within 1%, 5%, and 10% of the true mean, with a 95% confidence level. (Sims-ISWS)

ALGAL ASSAY PROCEDURE WITH ONE OR FIVE SPECIES. MINITEST.
Uppsala Univ. (Sweden). Algal Assay Lab
A. Clasesson, and A. Forsberg.
In: Syposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mittellungen No 21, June 1978, p 21-30. 6 fig, 2 tab, 13 ref

Descriptors: *Testing procedures, *Bioassay, *Methodology, *Minitest, *Bottle test, *Algae, Cultures, Selenastrum capricornutum, Ankistrodesmus falcatus, Chlorella homosphaera, Euglena gracilis, Scenedesmus quadricauda, Plant growth, Toxicity, Waste water(Pollution), Algal growth potential, Limiting factors, Carbon, Water pollution effects, Lakes, Eutrophication.

A miniature version of the standard algal assay bottle test, called the Minitest, yields results essentially the same as with the conventional test, which must be modified for large-scale screening application. Minitests are performed in small plastic tubes containing a culture volume of 2.5 ml. This paper describes two Minitest methods: (1) Selenastrum capricornutum as a single test alga, routinely used for determining maximum algal growth potential (AGP) and limiting nutrients in lake water; and (2) a combination of S. capricornutum, Ankistrodesmus falcatus, Chlorella homosphaera, Euglena gracilis, and Scenedesmus quadricauda mixed on an equal cell volume basis, used to estimate AGP and indicate toxic effects of wastewater. All algae are axenically grown in Z8 medium except Euglena, grown in Wolken's medium (1961). Preparation of the inoculum involves three phases: (1) stock cultures kept one week in 20% Z8 or Euglena medium in E-flasks; (2) starving in P-free, N-poor medium for one week; and (3) mixing of starved algae on an equal cell volume basis, giving a 'standard recipient.' Incubation is normally three days for wastewater and two weeks for lake water. Whereas carbon deficiency is common in algal assays, Minitest cultures did not require carbon dioxide bubbling or HCO3 enrichment when punched stoppers were used. THE CULTURE COLLECTION POINT OF VIEW.
Culture Centre of Algae and Protozoa, Cambridge (England).
E. A. George
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mittelungen No 21, June 1978, p 31-33.

Descriptors: *Cultures, *Algae, *Testing, *Storage, *Basic data collections, Methodology, Classification, Chlorella, Storage, Storage requirement, Nitrogen, Freeze drying, Culture media, Service collections, Data processing, Bacteria, Fungi, Protozoa, Survival.

Techniques of maintaining service collections of algae, fungi, or bacteria are described. A service-oriented collection should maintain and supply all worthwhile cultures within its interest area and collects and supplies information relating to them. Most strains are either taxonomic types or the subjects of other published research. Essential or valuable procedures include: (1) recording of full and accurate data when a strain is deposited, (2) careful labelling, (3) keeping a record of issue of strains, (4) reference to strains in publications, and (5) maintenance of a collection of user publications. Most algal strains are maintained as active cultures needing subculturing every few months or even weeks, but progress is being made towards preservation by freezing or drying. The Culture Centre of Algae and Protozoa (Cambridge, United Kingdom) now has all of its Chlorella strains and many other Chlorococcales under liquid nitrogen, and survival is usually over 90%. The main external factors affecting survival are growth temperature prior to freezing, age of cultures, possible use of protective additives, and rate of cooling and thawing. The World Federation of Culture Collections has published a world directory of data on culture collections and of the species they hold, and are now in the process of banking data on every strain in culture. PHYSIOLOGICAL INDICATORS OF NUTRIENT DEFICIENCY IN ALGAE,
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst.
F. P. Healey.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mittelungen No 21, June 1978, p 34-41. 5 fig, 7 ref.

Descriptors: *Algae, *Plant physiology, *Bioindicators, *Nutrient deficiency, *Limiting factors, *Methodology, Analytical techniques, Nutrients, Essential nutrients, Anabaena variabilis, Canada, Lakes, Cultures, Phosphorus, Nitrogen, Phosphates, Phosphatases, Metabolism, On-site tests.

Cultural studies have shown that a number of kinds of algae respond in a qualitatively manner to nutrient deficiencies. This paper demonstrates that: (1) such qualitative generalizations can be converted into quantitative terms for most algae, and (2) the cultural data is comparable to data for natural populations and can be used to quantify nutrient deficiencies in natural populations. Phosphorus deficiency generally lowers phosphorus content, and causes increased alkaline phosphatase activity and ability to take up phosphate. Nitrogen deficiency lowers the nitrogen content, while increasing the ability to take up ammonium. Lowered chlorophyll and protein with raised carbohydrate contents are general responses to nutrient deficiency. Physiological responses to phosphorus deficiency is illustrated using Anabaena variabilis. Effects of nutrient deficiency on nitrogen and phosphorus content of a variety of algae are described and figured; algal types include chlorophytes, cyanophytes, diatoms, chrysophytes, and dinoflagellates. Indicators of nutrient deficiency taken from cultural studies are then compared with results of field studies conducted at several central Canadian lakes, including the south basin of Lake Winnipeg, South Indian Lake, and a small prairie lake in Manitoba. A MODIFIED TURBIDOSTATIC SYSTEM FOR ALGAL POPULATION STUDIES,
Euratom European Community, Varese (Italy)
G. Premazzi, O. Ravera, and A. Lepers.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mittelungen No 21, June 1978, p 42-49. 6 fig, 2 tab, 7 ref.

Descriptors: *Algae, *Phytoplankton, *Turbidostats, *Bioassay, *Testing procedures, *Laboratory equipment, Research equipment, Methodology, Continuous flow, Pollutants, Selenastrum minitum, Primary productivity, Cadmium, Nutrients, Culture media, Chlorophyta

A new type of turbidostat has two important advantages: (1) population density is controlled by a photodetector sensor with one threshold, and (2) the difference between the photoelectrical relays is minimized. In addition to comparing the growth rate of algal populations cultivated on media with different macro- and micro-nutrients, the system may record quantitatively and continuously the effects of any pollutant on the primary production of algal populations. The system is illustrated with an experiment on effects of low concentrations of cadmium salts on a population of the chlorophyte Selenastrum minutum. Variation in population density is the most common parameter used to measure effects of a pollutant, and planktonic algae and other microorganisms with a fast turnover rate are often used to assay pollutants. A turbostat controls growth internally--rate of flow is controlled by cell density. Essential features of a turbidostat include (1) an optical balance which compares the optical density of the culture with that of a reference, and (2) a feed-back loop by which a voltage signal operates on an on-off valve in a fresh medium line. The new turbidostat comprises a culture vessel in which cells are grown isolated from contamination, a nutrient supply system, a culture agitation system, an optic-electronic system with a photodetector to monitor population density, and a system of drainage that removes fluid from the culture vessel as the same rate as the fresh medium is supplied. SOLUBILIZATION OF BIOLOGICALLY AVAILABLE PHOSPHORUS BY AUTOCLAVING SELENASTRUM.
FMC Corp., Princeton, NJ. Research and Development Dept.
J. Saldick, and J. F. Jadlocki, Jr.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mittelungen No 21, June 1978, p 50-56. 4 tab, 5 ref.

Descriptors: *Selenastrum capricornutum, *Phosphorus, *Bottle test, *Bioassay, *Autoclave, *Testing procedures, Solubility, Plant growth, Phytoplankton, Algae, Nutrients, Phosphates, Methodology, Limiting factors, Eutrophication, Lakes, Streams, Chlorophyta

EPA's manual for use of the algal assay bottle test in studies of the nutritional state of lakes and streams recommends either filtration alone or autoclaving for sample pretreatment before inoculation with test algae. The present experiments were undertaken to measure the fraction of algal cell phos-

phorus that would be released by autoclaving and made available for growth of the chlorophyte Selenastrum capricornutum in the bottle test. It is concluded that the nutritional state of algae present in test water samples influences results and must be considered in interpretation. Autoclaving solubilized 70-85% of the phosphorus contained in Selenastrm but only 15-45% appeared as soluble reactive phosphorus (SRP). The soluble but nonreactive phosphate (total soluble phosphorus minus SRP) was generally not available for cell replication in 21 days in the bottle test, but there were some exceptions in which a portion of this fraction was used. SRP was consistently available in the 21-day bottle test. Retardation of growth rate due to removal of essential micronutrients other than iron was observed when the cell population at the time of autoclaving was sufficiently high. Recently acquired surplus phosphorus was released as SRP in greater yield (about 50%) by autoclaving than older surplus phosphorus. To the extent that Selenastrum is a typical alga, autoclaving of natural waters containing other algae will be given similar phosphorus solubilization. (See also W79-03842) (Lynch-Wisconsin)

CULTURES OF CLADOPHORACEAE IN WATER POLLUTION PROBLEMS,
Zurich Univ. (Switzerland). Pflanzenbiologisches Inst.
F. Schanz, and E. A. Thomas.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No 21, June 1978, p 57-64. 5 fig, 1 tab, 19 ref.

Descriptors: *Cladophoraceae, *Cladophora, *Rhizoclonium, *Eutrophication, *Test organisms, Algae, Water pollution control, Nutrients, Culture media, Testing procedures, Toxicity, Lead, Cadmium, Copper, Zinc, Heavy metals, Chlorophyta.

Numerous experiments show Cladophoraceae (Chlorophyta), especially Cladophora and Rhizoclonium to be good test organisms for water pollution control studies, because yield of the alga is dependent on several factors associated with eutrophication; these include nutrient salt concentration, extracellular products of bacteria, thiamine concentration, and sensitivity to several heavy metals. Growth experiments were conducted with axenic cultures of Cladophora (zinc and copper) and Rhizoclonium (zinc, copper, lead, and cadmium) to detect effects of heavy metals. Toxic concentrations were: zinc 0.1 mg/l, copper 0.05 mg/l, lead 1.2 mg/l, and cadmium 0.01 mg/l. Tests of effects of lead concentration on Rhizoclonium growth showed that only 50-80% is available to the alga, with the rest eliminated by precipitation or absorption. Maximum concentration of lead in Rhizoclonium experiments was 10,000. The quantity taken up by algae dependend linearly on the added lead concentration. Cladophoraceae are among dominant algae growing on the shores of lakes and rivers, and among them Cladophora and Rhizoclonium have the highest mass production. Laboratory populations as yet have not been brought to the level of growth found in nature. Cladophoraceae prefer an environment with relatively high concentrations of nutrient salts; they will not grow in synthetic nutritive solutions, requiring certain bacteriologically produced substances for growth. COMPARISON OF BIOASSAY PROCEDURES FOR GROWTH-LIMITING NUTRIENTS IN THE LAURENTIAN GREAT LAKES,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
C. L. Schelske, E. D. Rothman, and M. S. Simmons.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No 21, June 1978, p 65-80. 6 fig, 8 tab, 11 ref. EPA 800965.

Descriptors: *Great Lakes, *Bioassay, *Testing procedures, *Limiting factors, *Phytoplankton, *Nutrients, Algae, Lake Michigan, Lake Huron, Lake Erie, Methodology, Phosphorus, Silica, Nitrogen, Chlorophyll, Eutrophication, Oligotrophy, Population dynamics, Analytical techniques, Lakes, Water pollution effects, Selenastrum.

Three bioassay procedures for growth-limiting nutrients are compared using water samples from lakes Erie, Michigan, and Huron; both natural phytoplankton populations and unialgal culture of Selenastrum capricornutum were used as bioassay organisms. The three procedures are: (1) a fixed-level experiment with natural phytoplankton assemblages, (2) a spiked test with natural phytoplankton assemblages, and (3) a spiked test with the Chlorophyte Selenastrm. Changes in chlorophyll standing crops are usually used to determine effects of treatments on algal growth. Results indicate that: (1) bioassay techniques can be used to determine if added substances will affect phytoplankton growth in oligotrophic waters; (2) measurable responses can be obtained from spiked experiments with additions as small as 1.0 micrograms P/l; and (3) natural populations can be effectively used to determine growth-limiting nutrients, and provide important ecological data on population dynamics not possible using maintained algal cultures. Investigation of effects of phosphorus, nitrogen, and silicon demonstrate that phytoplankton in Lakes Huron and Michigan are phosphorus limited, but not in Lake Erie. Water samples ranged from highly eutrophic (western Lake Erie) to relatively oligotrophic (Lake Michigan and Lake Huron). In the tests nutrient levels were ambient, plus three additions of phosphorus ranging from 5-15 micrograms/l, two additions of silica at 0.8 and 1.6 mg SiO2/l, and one addition of nitrate at 0.3 mg N/l. PRINCIPAL ASPECTS CONCERNING THE BATCH TECHNIQUE IN ALGAL ASSAYS,
Copenhagen Univ. (Denmark). Freshwater Biological Lab.
E. Steemann-Nielsen.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No 21, June 1978, p 81-87. 6 fig, 8 ref.

Descriptors: *Batch cultures, *Bioassay, *Testing procedures, *Methodology, *Algae, *Eutrophication, Cultures, Photoperiodism, Phytoplankton, Selenastrum capricornutum, Nitzschia palea, Standing crops, Nutrients, Toxicity, Water pollution effects, Analytical techniques, Plant growth, Growth rates, Chlorophyta, Diatoms, Chrysophyta.

Batch culture algal assays can be used to investigate: (1) effects of nutrient concentration on maximum algal standing stock, (2) growth inhibition due to toxicity, and (3) influence of nutrient concentration on growth rate. There are often three phases in the development of a batch culture: (1) an initial lag phase where the growth rate gradually increases, (2) the logarithmic growth phase in which there is a constant growth rate representing maximum reproductive capacity, and (3) a stationary phase where the growth rate gradually decreases to zero. Such types of batch cultures should only be used where maximum algal standing stock is desired; a technique is presented in which the alga grows at a constant rate during the entire experiment. The inoculum must be taken from a culture grown under conditions identical with experimental conditions and when the culture is still in the logarithmic growth phase. Very dilute suspensions of the alga (the same order as found in natural noneutrophic habitats) are necessary for investigating effects of nutrient concentration for ecological purposes, and the algal uptake rate of the nutrient must be sufficiently small so that its concentration does not perceptibly decrease during the experiment. A higher algal concentration can be used in studies of the influence of toxic substances. Continuous irradiance is generally used with batch cultures. In this study, the chlorophyte Selenastrum capricornutum and the diatom Nitzschia palea were used. Counting techniques are discussed. (See also W79-03842) (Lynch-Wisconsin)

GROWTH OF OSCILLATORIA AGARDHII IN CHEMOSTAT CULTURE. 2. DEPENDENCE OF GROWTH CONSTANTS ON TEMPERATURE,
Uppsala Univ. (Sweden). Inst. of Limnology.
G. Ahlgren.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No 21, June 1978, p 88-102. 10 fig, 3 tab, 25 ref.

Descriptors: *Temperature, *Oscillatoria agardhii, *Chemostats, *Growth rates, *Bioassay, *Absorption, Batch cultures, Plant growth, Algae, Half-saturation constant, Phosphorus, Nitrogen, Maximum specific growth rate, Specific growth rate, Yield coefficient, Limiting factors, Nutrients, Cyanophyta.

Part I of this study investigated growth constants of the cyanophyte Oscillatoria agardhii at room temperature. This paper examines variation in those constants at different temperatures. Constants considered were: (1) maximum specific growth rate (maximum mu); (2) half-saturation constant for nitrogen and phosphorus (K sub s); and (3) yield coefficient (Y), e.g., the amount of cell mass produced per unit amount of nutrient used. Batch assays were carried out at temperatures of 12-28C and chemostat tests at 15, 20, and 25C. In batch assays, optimum temperature for maximum mu of O. agardhii was 23-25C at alight intensity of 37 microEinstens/sq m/sec. In chemostat tests, mean value of phosphorus contents (q sub p) at 15C was about twice the mean value at 25C (0.56 and 0.26% phosphorus of dry wt), while at 20C the mean value was 0.37%. Thus at lower temperatures algae appear to require a higher phosphorus content than at higher temperatures for the same growth rate. Y appears to be less influenced by temperature than phosphorus content is, and inversely; mean value of Y at 15 and 25C differs by only 25%. K sub s had a minimum at 20C, with only one-third the values at 15 and 25C, but inaccuracy of the methodology at very low concentrations may be responsible. It has previously been found that maximum nitrogen uptake rate (V sub max) varies with both light and temperature, while the half-saturation constant for uptake (k sub s) varies only with temperature. NUTRIENT KINETICS OF FRESHWATER PLANKTONIC ALGAE USING BATCH AND SEMICONTINUOUS METHODS,
Michigan Univ., Ann Arbor. Div. of Biological Sciences.
S. S. Kilham.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No 21, June 1978, p 147-157. 6 fig, 31 ref. NSF OCE 76-10183.

Descriptors: *Nutrients, *Kinetics, *Phytoplankton, *Batch cultures, *Testing procedures, *Monod equation, *Variable internal stores model, Algae, Diatoms, Cultures, Absorption, Methodology, Analytical techniques, Model studies, Mathematical models, Laboratory tests, Equations,

Limiting factors, Freshwater, Limnology, Michaelis-Menten equations, Semicontinuous cultures, Plant growth, Growth rates.

The Monod constant yield model and the variable internal stores model - both of which relate external nutrient concentration to the growth rate of phytoplankton - are outlined and compared both mathematically and experimentally, using published data on planktonic diatoms. The Monod model is a direct measurement of the relationship; the variable internal stores model is a two-step process explaining that relationship through an uptake step (described by the Michaelis-Menten equation) and a utilization step (which evaluates the relationship between internal cell quota of a nutrient and the steady-state growth rate). The two models provide comparable information on the dependence of the growth rate on external nutrient concentration. Although the Monod model is not as physiologically sophisticated as the variable internal stores model, it does provide basic kinetic information needed to evaluate growth response to external nutrient concentrations. Uptake kinetics alone cannot be used to predict the outcome of competition between two species, nor does knowledge of the uptake process alone provide sufficient information to evaluate the growth potential of an algal population. Several variables may affect use of kinetic information to interpret field data: temperature, light intensity, day length, clonal variability, and physical mixing processes and sinking. Algal growth rate appears to be controlled by only one nutrient at a time. Use of short-term batch cultures is a satisfactory shortcut for studying nutrient kinetics. THE VARIABLE CHLOROPHYLL-A FLUORESCENCE AS A MEASURE OF PHOTOSYNTHETIC CAPACITY IN ALGAE,
Oslo Univ. (Norway). Botany Lab.
G. Samuelsson, G. Oquist, and P. Halldal.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No. 21, June 1978, p 207-215. 7 fig, 7 ref.

Descriptors: *Photosynthesis, *Algae, *Chlorophyll, *Fluorescence, *Primary productivity, *Analytical techniques, Chlorella pyrenoidosa, Scenedesmus obtusiusculus, Methodology, Measurement, Pigments, DCMU, Herbicides, Research equipment, Carbon radioisotopes, Chlorophyta.

Variable fluorescence is a promising indirect measure of algal primary production and photosynthetic capacity, based on experiments in which the herbicide DCMU was added to cultures of the chlorophytes Chlorella pyrenoidosa and Scenedesmus obtusiusculus to achieve maximum in-vivo chlorophyll-a fluorescence. DCMU inhibits photosynthesis, halts all electron transport, and causes maximum fluorescence. Photosynthesis was measured by a modified carbon-14 fixation method. If the fluorescence method proves satisfactory, the time-consuming Winkler and Carbon-14 methods can be bypassed. Once a sample is collected, a complete fluorescence reading may be performed in less than five minutes, providing information on both chlorophyll content and photosynthetic capacity. Samples may also be stored for several hours in a dark, cold place without affecting accuracy. Two sources of error must be dealt with: (1) the variable component of fluorescence can produce errors of up to 50%, and instruments should be calibrated on the basis of the stable maximum readings obtained through DCMU inhibition; and (2) when chlorophyll extraction is part of the analysis, chlorophyll and its derivatives from inside animals will distort in-vivo fluorescence measurements. The high light level in the commercially available fluorometer used caused excitation above saturation, and to correct this, light intensity was reduced to 20% and exposure increased from one to five seconds. In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No. 21, June 1978, p 316-329. 2 fig, 6 tab, 20 ref.

Descriptors: *Toxicity, *Heavy metals, *Selenastrum capricornutum, *Batch cultures, *Bottle tests, *Bioassay, *Testing procedures, Algae, Phytoplankton, Chlorophyta, Methodology, Italy, Lakes, Water pollution effects, Water pollution control, Culture media, AAP medium, EDTA, Bioindicators.

The Algal Assay Bottle Test of the U.S. Environmental Protection Agency was successfully modified for use with the chlorophyte test alga Selenastrum capicornutum in predicting or assessing heavy metal toxicity in natural waters. Overall conclusions: (1) Selenastrum capricornutum is extremely sensitive to heavy metals and can be considered a good choice for toxicity bioassay. (2) The standard algal assay bottle test with a few modifications can be applied successfully as a reliable screening test for obtaining information on concentrations of various substances likely to be hazardous to phytoplankton. (3) Chemical analysis of complex wastewaters or natural waters receiving wastes is often inadequate for predicting toxicity; it is therefore useful to combine chemical analysis with biological tests. (4) Data is needed on the application of the Selenastrum test (especially in natural waters) before it can be widely used as a standard method for toxicity evaluation. Several experiments were performed in this study to: (1) verify Selenastrum sensitivity to heavy metals in a medium without EDTA; (2) assess toxic effect of heavy metals in the normal AAP medium; (3) evaluate use of the standard algal assay to predict potential toxicity of heavy metals in natural waters of different chemical composition, based on bioassays with water samples taken from 22 Italian lakes during spring overturn; and (4) demonstrate usefulness of the Selenastrum test to assess toxicity in natural waters. Descriptors: *Chemical analysis, *Bioassay, *Phytoplankton, *Eutrophication, *Testing procedures, *Algal growth potential, *Limiting factors, Algae, Sewage disposal, Water pollution effects, Sweden, Selenastrum capricornutum, Chlorophyta, Nutrients, Nitrogen, Phosphorus, Lake restoration, Batch cultures.

Results from use of algal bioassays in stuides since 1972 of the recovery of eutrophic lakes in Sweden are compared with information obtained by chemical analysis of water, with special reference to the concept of algal growth potential (AGP) and most-limiting nutrient. For some lakes having comparatively low chlorophyll content, AGP could be determined equally well either by algal assay or by water chemical analysis. For more eutrophic lakes, algal assay AGP was often much higher than the calculated value, partly because thawing frozen water samples increased dissolved organic nutrients, in turn increasing algal growth and overestimating AGP in very eutrophic lakes. Calculating AGP from water chemical data ignored dissolved organic nutrients, thus leading to underestimations. Algae assays performed with lake water involved only the chlorophyte Selenastrum capricornutum with a modified batch culture technique. For assays of sewage effluent five species were uses: a mixed culture of Ankistrodesmus falcatus, Chlorella sp., Euglena gracilis, Secendesmus quadricauda, and Selenastrum capricornutum. Growth-inhibiting or toxic effects are normally difficult to detect by standard chemical analysis, and nutrient bioavailability and growth rate can only be determined by bioassay. Chemical analysis can be satisfactorily used to determine the limiting nutrient when the ratio is high or low, but for situations where nitrogen and phosphorus are in better balance, algal assay helps carify the limiting nutrient. Natural phytoplankton populations from Castle Lake and Lake Tahoe, California, incubated both in-situ and in a continuous-light incubator, were used in experiments on limiting effects of nitrogen. In environments with extremely low nitrients, as in these lakes, only part-per-billion additions of nutrients are required, and conventional culture technique are not likely to be effective. Adaptation time may be required for enzyme levels to respond to increased substrate levels, and photosynthetic inhibitionis requently the first response measured. In Castle Lake the nitrogen response is complicated by a natural molybdenum deficiency. Culture experiments with natural phytoplankton populations were conducted there to determine the relative availability of nitrogen with and without molybdenum. In early August 1975, fiver micrograms/l of molybdenum was inhibiting with nitrogen and phosphorus in short supply (three micrograms nitrate/l, no detectable ammonia, and two micrograms/l phosphorus). The combination of nitate-nitrogen, phosphorus, and molybdenum was most stimulating, follwed by nitrogen and phosphorus. By early September nitrogen limitation was very pronounced, and the organisms' ability to utilize nitrate without molybdenum was greatly reduced. In Lake Tahoe experiments, Fragilaria crotonenesis, a dominant diatom, showed particular response to nitrate addition in the nitrogen-limiting lake. Various other experiments at the two

lakes are also described. (See also W79-03842). (Lynch-Wisconsin)

Descriptors: *Testing procedures, *Classification, *Chlorophyta, *Tetrasporales, *Phytoplankton, *Culture media, *Agar, Cultures, Methodology, Algae, Chlorella, Chlamydomonas, Chlamydocapsa bacillus, Phyllocardium, Stigeoclonium, Priddy Pool(England), Abbot's Pool(England), England, Eutrophication, Ponds, Elodea canadensis, Sphagnum, Epiphytes, Epipelic algae, Flagellates, Ecology.

A method of identifying and enumerating small, motile chlorophyte algae (especially the little-studies Tetrasporales) involving culture of field samples on agar plates is described as well as application of the method to algal samples from eutrophic Abbot's Pool and shallow, acid Priddy Pool in Somerset, England. Results show that such algae occur frequently in freshwater algal communities, and that distribution, growth patterns, and periodicity vary among species. Ecological studies will be reported in a future paper. Sample of naturally occurring phytoplankton, epipelic algae, and algae associated with the macrophyts Elodea canadensis and Sphagnum spp. were collected at the two pools, and were incubated on nutrient agar plates (2% concentration) for 14 days. Numbers and types of colonies were counted, and single colonies were isolated and transferred to liquid media for further study and species identification. Genera of small chlorophytes found on the plates included Asterococcus, Carteria, Chlamydocapsa, Chlamydomonas, Chlorella, Chlorococcum, Chlorogonium, Gloeomonas, Gonium, Kirchneriella, Phyllocardium, Scourfeldia, Spermatozopsis, Sphaerellopsis, Sphaerocystis, and occasional colonies of the filamentous Stigeoclonium. Nine species are discussed: Chlorella minutissima, C. vulgaris var. Vulgaris, Chlamydomonas perpusilla, Ch. altered, Ch. sphagnophila, Ch. acutata, Chlamydocapsa bacillusl, Phylocardium sp., and Stigeoclonium sp. (See also W79-03842). (Lynch-Wisconsin)

Descriptors: *Algal growth potential(AGP), *Norway, *Lakes, *Rivers, *Eutrophication, *Bioassay, Selenastrum capricornutum, Algae, Phytoplankton, Chlorophyta, Cultures, Nutrients, Nitrogen, Phosphorus, Plant growth, Lake Mjosa(Norway), Halden watercourse(Norway), Oligotrophy, Water pollution effects.

Some 2000 determinations of algal growth potential (AGP) made in the Ostlandet region of eastern Norway using the chlorophyte Selenastrum capricornutum as the test organism showed that algal growth in naturally oligotrophic inland waters can often be stimulated by small nutrient additions. The fertility of over 400 lakes and rivers in the region (near the Oslofjord) was studied; a selection of the results is presented in tables and figures. Whereas chemical analysis provides data on nutrient concentrations, bioassays are necessary for information on nutrient availability and the capacity of water for sustaining algal growth. Phytoplankton in lakes show seasonal qualitative changes as well as variation in total biomass. In rivers, seasonal variations of AGP are difficult to outline; the annual cycle of plant nutrient abundance is influenced by such external factors as surface drainage and such internal factors as metabolic processes of organisms. The Halden watercourse and Lake Mjosa system are discussed in some detail. In the former, water from oligotrophic-dystrophic Lake Floen flows through the River Holandselv into Lake Bjorkelangen and soutward through a chain of lakes. The water receives municipal sewage and agricultural runoff, resulting in considerable eutrophication, especially downstream of Lake Bjorkelangen. Lake Mjosa, increasingly eutrophic due to urbanization, belongs to the group of Norwegian fjord lakes which are fundamentally oligotrophic. Phytoplankton in the lake are dominated by diatoms. SOME ASPECTS ON THE CLASSIFICATION OF NATURAL WATERS BY ALGAL ASSAYS (SGP), PRELUDE,
Helsinki Univ. (Finland). Dept. of Limnology.
P. O. Lehmusluoto.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No 21, June 1978, p 437-440. 11 ref.

Descriptors: *Algal growth potential(AGP), *Trophic level, *Methodology, *Classification, *Lakes, *Bioassay, Algae, Limnology, Testing procedures, Water bodies, Nutrients, Eutrophication, Organic matter, Salinity, Dry weight, Indicators.

Algal growth potential (AGP), a measure of nutrient conditions, cannot be used as an indicator of trophic status because trophism refers to the amount of organic matter supplied to a water body per unit time. An AGP test made during the period of growth may be inverse to trophic state measures since it reflects remaining nutrient conditions. Trophic status includes functional and dynamic dimensions, which are not accounted for by AGP. AGP was originally intended for use in eutrophication studies for: (1) assessment of a receiving water's nutrient status and sensitivity to change; (2) evaluation of materials and products for potential effects on algal growth in receiving waters; and (3) assessment of changes in waste treatment processes on receiving waters. In measuring AGP, use of algal dry weight as a parameter should either be avoided or done with care because results may be misleading; salinity-dependent errors may also occur. Dry weight measurements appear reliable if algal mass on the filter is over 1.0-1.2 mg dry wt, usually corresponding to a concentration of more than 3-5 mg dry wt/l. Salt concentration may cause an additional dry weight on the filter when algal populations are not dense. Repeated washing of the filter may reduce salt-dependent dry wt by 50-70%, but some will remain. In addition, algal growth is very sensitive to salinity changes. Brackish water algae grow better at higher salinities. (See also W79-03842) (Lynch-Wisconsin)

PHOSPHORUS AVAILABILITY IN THREE STREAMS DURING STORM EVENTS: CHEMICAL ANALYSIS VS. ALGAL ASSAY,
Kent State Univ., Ohio. Dept. of Biological Sciences.
E. T. Long, and G. D. Cooke.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No 21, June 1978, p 441-452. 8 fig, 12 ref. US EPA R801936.

Descriptors: *Bioassay, *Phosphorus, *Storm runoff, *Chemical analysis, *Available phosphorus, *Twin Lakes Watershed(OH), *Streams, *Urban runoff, Ohio, Algae, Selenastrum capricornutum, Chlorophyta, Methodology, Testing procedures, Eutrophication, Lakes, Nutrients, Soluble reactive phosphorus, Total phosphorus, Bottle test, Forest watersheds, Drainage, Land use, Nutrient budgets, Nutrient loading, Bioavailability, Model studies.

Algae bioassay determined biologically available phosphorus contributed to lakes during storms by three streams in northeast Ohio's Twin Lakes Watershed, one draining an urban area, one a forest, and one a lake. Results were compared with chemical determination of total and soluble reactive phosphorus. Conclusions: (1) Because of storm runoff loading rates should be determined according to hydrological rather than calendar events. (2) Land use greatly affected loading rates; urban areas have greater impact than forests or lake drainage. (3) Available phosphorus differs considerably from total phosphorus loading, both during storms and during base flow. (4) Use of biologically available phosphorus in nutrient budgets might enhance predictability of limnological models relating changes in phosphorus income to degree of eutrophication. Chemical determination of phosphorus includes some forms of phosphorus (designated soluble reactive phosphorus) which are functionally inactive in the lake environment. During base flow, available phosphorus made up only a small fraction of total phosphorus; during storms this fraction increased greatly from the urban and forest areas, but not from the lake discharge. Considerably greater amounts of all three forms of phosphorus were contributed during storm runoff from all three areas studied, but the urban area contributed much more of all three phosphorus forms. MONITORING THE EFFECTS OF CHEMICAL AND BIOLOGICAL WASTE WATER TREATMENT IN SITU BY DIALYSIS CULTURES OF FRESHWATER ALGAE,
Bergen Univ. (Norway). Inst. for General Microbiology.
M. Laake.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No. 21, June 1978, p 453-472. 11 fig, 8 tab, 17 ref.

Descriptors: *Dialysis, *Analytical techniques, *Waste water treatment, *Bioassay, *Testing procedures, Algae, Phytoplankton, Scenedesmus quadricuda, Selenastrum capricornutum, Chlamydomonas reinhardtii, Asterionella formosa, Chlorophyta, Heavy metals, Carbon, Chlorophyll, Nutrients, Limiting factors, Phosphates, Norway, Activated sludge, Biological treatment, Cultures, On-site tests.

Four phytoplankton species were used in dialysis cultures to study effects of four biochemical sewage treatment processes at an experimental plant outside Oslo, Norway. Unialgal (Scenedesmus quadricauda) and mixed (Scenedesmus, Selenastrum capricornutum, Chlamydomonas reinhardtii, and Asterionella formosa) cultures were inoculated into twelve 32-ml dialysis bags attached to a rotating wheel submerged in flow-through plastic

boxes exposed to daylight. Growth was measured by optical density at 430 nm. Cells were analyzed for organic carbon, chlorophyll-a and phaeophytin, ATP, and heavy metals (copper, zinc, cadmium, and lead). Types of treated wastewater: (1) secondary Al treatment plus biological oxydation pond (Al + BD); (2) secondary Al treatment (Al); (3) activated sludge biological treatment plus Al (B+ Al); and (4) activated sludge with simultaneous Al-treatment (SIM). SIM generally gave the highest cell yield, with the others more or less equal. ATP content per cell was proportional to wastewater load in mixed cultures, but increased with Scenedesmus along. Mean levels of 0.6 micrograms ATP/mg C confirm phosphate limitation. Chlorophyll was proportional to load for all treatments. Scenedesmus grew better in mixed than in unialgal culture. Algal growth efficiency with phosphate limitation may be ranked as Al + BD, Al, B + Al, and SIM. Heavy metal concentration factors were 1,000,000 for cadmium, 400,000 for lead, and 20,500 for zinc. APPLICATION OF ALGAL ASSAYS IN THE ENVIRONMENTAL EVALUATION OF NEW DETERGENT MATERIALS,
Proctor and Gamble Co., Cincinnati, OH. Environmental Safety Dept
A. G. Payne, and R. H. Hall.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No. 21, June 1978, p 507-520. 17 fig, 10 ref.

Descriptors: *Detergents, *Bioassay, *Trisodium nitrilotriacetate, *Sodium citrate, *Sodium aluminosilicate, *Testing procedures, Algae, Environmental effects, Water pollution effects, Bottle test, Chlorophyta, Cyanophyta, Selenastrum capricornutum, Microcystis aeruginosa, Anabaena flos-aquae, Methodology, Metals, Trace elements, Toxicity, Nutrients, Plant growth, Pollutants, Algistatic concentrations, Burntside Lake(MN), Lake James(NC), Phosphate substitutes, Proctor and Gamble Company.

Algal assays have been used by the Procter and Gamble Company to evaluate environmental safety of potential detergent materials. EPA's algal assay bottle test has been successfully applied by the company (with modifications) to studies of stimulation, chelation, and toxicity using the chlorophyte Selenastrum capricornutum, and the cyanophytes Microcystis aeruginosa and Anabaena flos-aquae. Algal stimulation studies with trisodium nitrilotricetate (NTA) and sodium citrate, under consideration as phosphate substitutes, showed no significant effects on algal growth in representative rivers, lakes, and canals in several localities, including Lake James, North Carolina, Lake Erie, and Lake Michigan. Sodium aluminosilicate (SAS), a potential detergent builder, likewise would not be a significant factor in algal stimulation, toxicity, or general nutrition. At Burnside Lake, Minnesota, addition of NTA and SAS under conditions of adequate nitrogen and phosphorus supply resulted in slight increases in algal growth rates, but no increase in maximum standing crops. The bottle test with M. Aeruginosa was a good techniuqe for trace metal/chelator studies. A toxicity assay procedure using the bottle test is described for determining a test material's algistatic concentration (the level at which there is no net change in algal population.) This criterion is proposed as a less-arbitrary index of algal toxicity than 50% reductions in standing crop (EC50), or growth rate (TL50). (See also W79-03842) (Lynch-Wisconsin)

ALGAL TESTS USED TO STUDY THE CHEMICAL FACTORS REGULATING THE GROWTH OF PLANKTONIC ALGAE IN THE HELSINKI SEA AREA,
Helsinki City Engineer's Office (Finland). Water Conservation Lab.
I. Rinne, and E. Tarkiainen.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. International Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No. 21, June 1978, p 527-546. 2 fig, 14 tab, 23 ref.

Descriptors: *Helsinki(Finland), *Gulf of Finland, *Phytoplankton, *Eutrophication, *Nutrients, *Trace elements, *Bioassay, Algae, Chlorella, Chlorophyta, Nodularia, Cyanophyta, Gulfs, Water pollution effects, Sewage disposal, Vantaa River(Finland), Finland, Coasts, Archipelagos, Limiting factors, Nitrogen, Phosphorus, Plant growth, Water chemistry, Rivers, Statistical methods, Testing procedures.

Chemical factors (nitrogen, phosphorus, and seven trace elements) which regulate phytoplankton growth were studied April-October 1973-75 in the Helsinki sea area of the Gulf of Finland by means of algal assays and analysis of water nutrient content. Assays with the chlorophyte Chlorella sp. and results of ratio tests showed nitrogen more important than phosphorus in regulating growth; however, phosphorus was in short supply during spring in the very eutrophic bays, and both nutrients were low in less-polluted outer areas during summer. Assays with Nodularia sp. showed that phosphorus was the growth-limiting factor for this nitrogen-fixing blue-green alga, especially in spring and early summer. The waste load discharged to the increasingly eutrophic area consists primarily of untreated municipal sewage from Helsinki and Espoo (about 450-500 tons phosphorus and 2400-2600 tons nitrogen/yr), and polluted water discharged by the Vantaa River (about 100 tons P and 1500 tons N/yr). Salinity variations of 3-6% in summer do not affect growth of Chlorella. Inner bays (over 100 mg C sub ass./cu m/day) and the inner archipelage (200-1000 mg) are eutrophic, and the outer archipelago is fairly clean (< 200 mg); each area was sampled. Samples were enriched with nitrogen, phosphorus, and trace amounts of boron, manganese, zinc, cobalt, copper, molybdenum, and iron in various combinations. (See also W79-03842) (Lynch-Wisconsin)

COHO SALMON (ONCORHYNCHUS KISUTCH) AND HERRING GULLS (LARUS ARGENTATUS AS INDICATORS OF ORGANOCHLORINE CONTAMINATION IN LAKE ONTARIO,
Canadian Wildlife Service, Ottawa (Ontario). Wildlife Toxicology Div.
R. J. Norstrom, D. J. Hallett, and R. A. Sonstegard.
Journal of the Fisheries Research Board of Canada, Vol. 35, p. 1401-1409, 1978. 1 fig, 5 tab, 25 ref

Descriptors: *Bioindicators, *Chlorinated hydrocarbon pesticides, *Coho salmon, *Gulls, *Pesticide residues, Insecticides, Polychlorinated biphenyls, DDE, DDD, Dieldrin, Great Lakes, Lake Ontario, Smelts, *Mirex, *Tissue analysis, *Bioaccumulation, Pollutant identification, Alewives.

Coho salmon and herring gulls in the Great Lakes depend to a large extent on alewives and smelt for their food. All of these species range widely in the lakes, and therefore provide an integrated measure of levels of organochlorine contaminants in the lakes. Organochlorine residues were determined in herring gull eggs from four eastern Lake Ontario colonies, coho salmon from western Lake Ontario, and pooled alewife and smelt from the stomach contents of the salmon. The mean apparent bioconcentration factor was 2.9 + or - 0.7 for accumulation of PCBs, DDE, mirex, photomirex, HCB, dieldrin, and DDD. The bioconcentration factor was 50 + or - 10 for accumulation of PCBs with more than five chlorines, DDE, mirex, and photomirex in herring gull eggs. PCBs with fewer than six chlorines, HCB, dieldrin, and DDD were concentrated concentrated to a lesser extent in herring gull eggs. Assuming an apparent bioconcentration factor from water of 5 x 10(5) for accumulation of PCBs, DDE, mirex, and photomirex in smelt and alewives, the corresponding values in coho salmon and herring gull eggs were 1.5 x 10(6) and 2.5 x 10(7). CHARACTERISTICS OF THE MOSCOW RIVER WATER QUALITY ACCORDING TO HYDROBIOLOGICAL INDICES,
V. A. Abakumov, and G. L. Margolina
In: Proceedings of the First and Second USA-USSR Symposia on the Effects of Pollutants Upon Aquatic Ecosystems - Vol 1, Environmental Protection Agency, Report EPA-600/3-78-076, p 32-35, 1978.

Descriptors: *Water quality, *Aquatic populations, Moscow River, USSR, Water quality control, Bacteria, Phytoplankton, Zooplankton, Benthic fauna, Microorganisms, Plant populations, Primary productivity, Tophic level, Water treatment, Waste treatment, Hydrobiology, W P effects, *Species diversity, *Hydrobiological indices, Biological indicators.

In order to obtain hydrobiological indices characterizing the water quality of the Moscow River, the qualitative and quantitative composition of bacterioplankton, phytoplankton, zooplankton, zoobenthos, and higher water plants were studied. The authors concluded that it was essential to apply a combination of water quality control methods according to hydrobiological indices which provide information not only on water pollution, but also on the state of aquatic organisms in water bodies. ENDPOINTS IN BIOASSAY,
L. L. Smith, Jr.
In: Proceedings of the First and Second USA-USSR Symposia on the Effects of Pollutants Upon Aquatic Ecosystems - Vol. 1, Environmental Protection Agency, Report EPA-600/3-78-076, p 36-36, 1978. 3 fig, 3 tab, 8 ref.

Descriptors: *Bioassay, *Toxicity, *Analytical techniques, *Chemical properties, Methodology, Lethal limit, Biochemistry, Enzymes, Growth stages, Chemical analysis, Reproduction, Mortality, Fecundity, Fertility, Growth rates, Animal physiology, Animal metabolism, Fish physiology, Laboratory tests, *Toxicity testing.

The purpose of this discussion was to elaborate on means of defining meaningful endpoints and interpreting the resultant findings. It was recommended that (1) the most sensitive stage be used where possible as the basis for acute median tolerance limit tests; (2) temperature used for tests should approximate the natural conditions to which the fish will be subjected during critical periods in the outdoor environment; (3) median tolerance limit value should be based on the time at which an asymptote is reached in the decline of the toxicity curve; (4) where possible, reproductive behavior and success be used as the final criterion of the proper endpoint used to determine safe concentration of toxicants or effluents; and (5) uniform application factors not be used over a broad spectrum of species or toxicants without definitive chronic tests. During the early decaded of this century basic standards for maximum permissible concentrations of harmful substances discharged into water bodies were introduced in many countries. The dominant role in establishing these standards belonged to medical specialists. However, in more recent years it was learned that levels of many substances which fully satisfy the health specialists do not guarantee the purity of water bodies from a general biological or fishing industry point of view. The author traces the development of knowledge in the area of fish biochemistry and physiology and how these advances have influenced standards for water quality. (See also W79-03906) (EIS-Deal)

MONITORING THE CONDITION OF FLOWING WATERS BY BIOLOGICAL ORANISMS,
R. Patrick.
In: Proceedings of the First and Second USA-USSR Symposia on the Effects of Pollutants Upon Aquatic Ecosystems - Vol. 1, Environmental Protection Agency, Report EPA-600/3-78-076, p. 68-81, 1978. 6 fig, 1 tab, 8 ref.

Descriptors: *Bioindicators, *Oysters, *Diatoms, *Monitoring, Biological communities, Diptera, Heavy metals, Cytological studies Chemical analysis, Water chemistry, Water quality, Sampling, Biomass, Eutrophication, *Tissue analysis, *Bioaccumulation.

It is evident that the monitoring of biological organisms can be very valuable in determining the effects of wastes. As contrasted with chemical and physical determinations of water quality, the organisms integrate over time all deleterious effects, whereas a chemical examination only determine the presence of the chemical for which analysis is made at the particular time. The biological studies often give an indication of a certain type of chemical or deleterious conditions being present. It is then necessary to determine exactly what chemical is causing the effect. Therefore, both types of studies become important, but the biological studies are the better continual monitoring studies if only one type of monitoring is to be made, because it integrates all changes which may occur. TOXIC ORGANIC RESIDUES IN FISH,
Michigan State Univ., East Lansing.
H. E. Johnson.
In: Proceedings of the First and Second USA-USSR Symposia on the Effects of Pollutants Upon Aquatic Ecosystems - Vol. 1, Environmental Protection Agency, Report EPA-600/3-78-076, p 115-120, 1978, 18 ref.

Descriptors: *Chemical wastes, *Industrial wastes, Organic compounds, Polychlorinated biphenyls, DDT, Toxicity, Fish physiology, Animal metabolism, Path of pollutants, Pesticide residues, Trophic level, Public health, Dieldrin, *Tissue analysis, *Bioaccumulation.

The development of sophisticated analytical techniques and intensified chemical monitoring efforts has shown that a wide variety of synthetic organic chemicals or their degradation products is present in the aquatic environment. One example is the detailed analysis of PCBs in fish from the Great Lakes. It is imperative that we develop a systematic approach for evaluaton of new materials and new technology. Important new efforts are being made to find correlations between chemical structure and biological activity. A chemical classification system based on physical properties, chemical structure, and biological activity would provide some indication of potential hazard. Simple model ecosystems and food-chain models offer additional promise for preliminary testing to identify harmful properties of chemicals. (See also W79-03906) (EIS-Deal)

REGISTRATION OF PESTICIDES: CONSIDERATIONS IN CONDUCTING AQUATIC TOXICITY TESTS,
R. A. Schoettger.
In: Proceedings of the First and Second USA-USSR Symposia on the Effects of Pollutants Upon Aquatic Ecosystems - Vol. 1, Environmental Protection Agency, Report EPA-600/3-78-076, p 166-180, 1978, 5 fig., 17 ref.

Descriptors: *Pesticides, *Pesticide toxicity, *Bioassay, Legislation, Regulation, Chemical properties, Chemical analysis, Fish food organisms, Toxicity, Absorption, Growth rates, Fish physiology, Lampreys, Pesticide kinetics, Water pollution effects, *Teratogens, *Toxaphene, *TFM, *Lampricides.

Requirements for registration, re-registration, and classification of pesticides for general of restricted use were published recently by the EPA. If the pesticide is intended for outdoor uses, data must generally be submitted that permit evaluation of hazards to non-target animals, including fish and wildlife. Depth of these evaluations depends on proposed patterns of use, environmental chemistry characteristics, and nature of the hazard to humans, domestic animals, and non-target animals. Data to support registeration can be obtained from acute and chronic or partial chronic toxicity studies, simulated field tests, or field monitoring and observation, as described in the extensive registration guidelines recently proposed by EPSA. Chronic testing techniques and apparatus, with controllable light and temperature, offer versatile systems for investigating effects of pesticides and other contaminants on fish according to daily and seasonal periodicity and simulated pesticide-use patterns. STRUCTURAL AND FUNCTIONAL CHARACTERISTICS OF SESTON AS INDICES OF WATER POLLUTION,
A. P. Ostapenya
In: Proceedings of the First and Second USA-USSR Symposia on the Effects of Pollutants Upon Aquatic Ecosystems - Vol II, Environmental Protection Agency, EPA-600/3-78-076, p 150-157, 1978. 5 fig, 1 tab.

Descriptors: *Seston, *Methodology, *Plankton, Phytoplankton, *Water pollution effects, Chlorophyll, USSR, Oxygen demand, Photosynthesis, Primary production, Trophic level, On-site investigation, Index of pollution, Bioindicators, Dissolved oxygen, Aquatic ecosystems, Aquatic populations.

Plankton has long been a traditional part of ecological investigations related to water pollution Accumulated data show convincingly that seston, including planktonic, detrital and mineral suspensions are an important, distinct structural component of aquatic ecosystems, functioning as a single entity. Seston actively influences the quality of water. This influence is diverse, and is evident by its action on the production and destruction stages of the biotic circulation. Structural and functional characteristics of the seston are sufficiently sensitive for use as an indicator in the evaluation of water pollution. (See also W79-03906) (EIS-Katz)

X-RAY ANALYSIS OF AIRBORNE ASBESTOS, DESIGN AND CONSTRUCTION OF A PROTOTYPE ASBESTOS ANALYZER,
Naval Research Lab., Washington, DC. Radiation Technology Div
L. S. Birks, J. V. Gilfrich, and J. W. Sandelin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 512, Price codes: A03 in paper copy, A01 in microfiche. Final Report No. EPA-600/2-78-194, August 1978. 23 p, 9 fig, 1 tab, 3 ref. Interagency Agreement EPA-IAG-D6-0651

Descriptors: *Asbestos, *Air pollution, *X-ray diffraction, *Spectroscopy, Analytical techniques, Instrumentation, Prototypes, Measurement, Clays, Mineralogy, Analysis, Prototype tests.

The design and construction of the working prototype asbestos analyzer is described. The analyzer incorporates the principal of broad-beam x-ray optics and a special fiber-alined sample. Two detectors are used for simultaneous measurement of diffracted signal and background. The prototype analyzer allows fibrous asbestos to be distinguished from nonfibrous forms or clay minerals of similar character, and relies on sample preparation where the asbestos fibers are oriented on a special grid. The x-ray optics allow specific 20 diffraction angles to be selected for large-area specimen deposits. Sub-microgram amounts of asbestos can be detected and quantitatively measured. The analyzer is contained in a 15 x 15 x 32 cm vacuum box and is mounted on top of a standard commercial x-ray supply. The Cr target spectrographic tube is located in a separate lead-shielded enclosure in the box. The beam trap, a critical component, reduces the backscattered noise signal to less than 100 photons/sec from an incident beam of 10 to the eleventh power photons/sec. (Davison-IPA)

RESULTS OF RESEARCH RELATED TO STRATOSPHERIC OZONE PROTECTION, REPORT TO CONGRESS,
SRI International, Menlo Park, CA.
R. E. Ruff, P. B. Russell, S. D. Kaplan, B. R. Holt, and J. W. Ryan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-284 400, Price codes: A03 in paper copy, A01 in microfiche. Report No. EPA-600/8-78-002, January 1978. First biennial report to Congress required by Section 153(g), PL 95-95. 50 p, 6 fig, 5 tab, 23 ref. 68-01-3939.

Descriptors: *Ultraviolet radiation, Aquatic life, *Plant growth, *Skin cancer, *Clean Air Act, *Ozone-depletion, Human diseases, Crustaceans, Social impact, Economic impact, Spectroradiometry, *Air pollution effects

The results of research conducted under Section 153 of Public Law 95-95 by the Environmental Protection Agency (EPA), and the results of related research and studies conducted by other Federal agencies is reported. Research on ozone protection has been coordinated under a Biological and Climatic Effects Research (BACER) Program, a multiagency, multidisciplinary effort originally funded by EPA. Its purpose is to reduce uncertainties regarding ozone-depletion to quantify ozone-depletion impacts wherever possible. The effects resulting from the release of ozone-depleting substances have been shown to impact on biological system and climate, which in turn have social and economic impacts. Activities include surveys of skin cancer among populations at different latitudes, measurements of Ultraviolet B (UV-B) radiation, tests of over 100 plant species under simulated and natural UV-B levels, experiments with aquatic ecosystems, and social economic workshops. Study results indicate: skin cancer incidence is related to UV-B exposure; all plants are sensitive to UV-B at some exposure level, resulting in stunting bleached or discolored leaves; and UV-B damages the larvae of shrimp, crab, mackerel, and anchovy. New UV-B monitoring devices developed include the Norris spectroradiameter for biological effects research and a submersible spectroradiometer for aquatic use. Future long term and short term research needs are discussed. (Davison-IPA)
W79-03977

A RAPID METHOD FOR ESTIMATING LOG P FOR ORGANIC CHEMICALS,
Environmental Research Lab.-Duluth, MN
G. D. Veith, and R. T. Morris.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-284 386, Price codes: A03 in paper copy, A01 in microfiche. Report No. EPA-600/3-78-049, May 1978. 24 p, 2 fig, 3 tab, 8 ref.

Descriptors: *Pollutant identifiction, *Chemical analysis, *Chromatography, *Organic chemicals, Logarithms, Equations, Laboratory equipment, Mathematics, Ultraviolet detectors, Laboratory tests, Time, Economics.

A study, using a variety of industrial chemicals, was conducted to determine if Log P and the high pressure liquid chromatography (HPLC) reverse phase retention time are related, and to develop an inexpensive method requiring less than an hour for estimating Log P by using HPLC. The technique developed estimates the n-octanol/water partition of organic chemicals. The system consisted of preparative Micro-Pak (R) C-10 reverse phase column eluted isocratically with a 15% water/85% methanol solvent pumped through the column at 2.0 ml/min at 1,200 psi. The chemicals were first dissolved in a mixture of acetone and cyclohexane, then detected in the eluant with 254-nm ultraviolet detector, a fraction collector was used for chemicals that cannot be detected by the ultraviolet detector. The fractions were analyzed to determine the retention time of the chemical. The log of the retention time (LogRT) of organic chemicals on a permanently bonded reverse-phase HPLC system is linearly related to the log of the n-octanol water partition coefficient (Log P): P = 5.106 Log RT-

1.258 with a correlation coefficient 0.975. By using a calibration mixture, the Log P of other organic chemicals were estimated with a mean accuracy of 22.8%. This technique permits estimation of Log P in a maximum of 25 minutes, and does not require a knowledge of the chemical structure for the estimate. (Davison-IPA)

MANUAL FOR THE INTERIM CERTIFICATION OF LABORATORIES INVOLVED IN ANALYZING PUBLIC DRINKING WATER SUPPLIES -- CRITERIA AND PROCEDURES,
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-287 118, Price codes: A05 in paper copy, A01 in microfiche. Report No. EPA 600/8-78-008, May 1978. 100 p, 5 tab.

Descriptors: *Laboratory certification, *Water Quality Act, Potable water, *Inspection, Water quality, Water analysis, Radiochemical analysis, Microbiology, Quality control, Water quality standards, Publications.

Evaluation procedures and minimum technical requirements recommended for interim certification of laboratories analyzing public drinking water supplies are described; optional certification requirements have been included. The manner in which the Environmental Protection Agency (EPA) will carry out a program for interim approval and certification of its 10 regional laboratories and principal state laboratories is described. Formal certification of a laboratory under regulatory authority is the preferred approach of a certification program. However, a phased approach has been selected because the interim regulations are already in effect. Interim approval will be granted to laboratories on an administrative basis in phase one to provide acceptable data for immediate implementation of the Interim Primary Regulations. After an on-site evaluation based on the contents of this manual, Interim Certification will be granted. The emphasis of this phase is to provide advice and technical requirements and optional requirements for conducting on-site evaluations of chemical, microbiological and radlogical laboratories are set forth. (Davison-IPA)

SAMPLING AND ANALYSIS RESEARCH PROGRAM AT THE PARAHO SHALE OIL DEMONSTRATION,
TRW Environmental Engineering Div., Redondo Beach, CA.
J. E. Cotter, C. H. Prien, J. J. Schmidt-Collerus, D. J. Powell, and R. Sung.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-284 027, Price codes: A03 in paper copy, A01 in microfiche. Final Report No EPA-600/7-78-065, April 1978. 80 p, 21 fig, 18 tab, 6 ref, 3 append. 68-02-1881.

Descriptors: *Pollutant identification, *Oil shales, *Liquid wastes, *Sampling, *Prototype tests, Chemical analyses, Chemical wastes, Laboratory tests, Analytical techniques, Chromatography, Mass spectrometry, Anvil Points, *Colorado.

A study of the eight oil shale retorting processes at the Paraho oil shale demonstration site at Anvil Points, Colorado, was undertaken to establish characteristics common to the processes to develop prototype sampling and analytical procedures for shale oil recovery operations. The Anvil Points operations includes two vertical retorts: a larger semi-works unit and a smaller pilot plant. The test plan included both retorts because their process streams are essentially different. Sample locations were determined by the need for information on process streams relative to emissions and effluents expected in a full scale plant. Samples taken included: the recycle gases, hydrogen sulfide, sulfur dioxide, oxides of nitrogen, ammonia and arsine; recycle condensate; process water; processed shale discharged from the retorts; and dust from the vicinity of the crushing and screening equipment. The various laboratory analyses included: wet chemical analysis, spark source mass spectrometry, high pressure liquid chromatography, thin layer chromatography, gel permeation chromatography, and gas chromatography/mass spectrometry (GC/MS). Condensate water inorganic analyses were done for calcium, magnesium, sodium and potassium salts, ammonia, gross parameters, and trace elements. Condensate and water samples were analyzed for organic neutrals, organic acids, and organic bases. Data obtained from the crushing and retorting operations are unique to the Paraho demonstration because much of the equipment and many of the operating procedures are not employed in a commercial venture. THE MULTIELEMENTAL ANALYSIS OF DRINKING WATER USING PROTON-INDUCED X-RAY EMISSION (PIXE),
Purdue Research Foundation, Lafayette, IN.
P. C. Simms, and F. A. Rickey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-287 832, Price codes: A04 in paper copy, A01 in microfiche. Final Report No EPA-600/1-78-058, September 1978. 58 p, 7 fig, 9 tab, 6 ref. 68-03-2178.

Descriptors: Pollutant identification, *Water analysis, *Chemical analysis, *Potable water, *Nuclear acceleration, *Water properties, X-ray analysis, Data processing, X-ray fluorescence, Vapor separation techniques, Filtration, Trace elements, Laboratory tests, Proton-induced x-ray emission, Spectroscopy, Water supply, Atomic absorption.

The use of energetic protons from a nuclear accelerator to perform quantitative, multi elemental analysis of drinking water is described. Before Proton Induced X-ray Emission (PIXE) could be used for aqueous samples, 'vapor filtration', a new method for depositing the elements on a backing suitable for proton bombardment, was developed. When a sample is bombarded with protons, characteristic x-rays emitted from each element can be used in identifying the element in the sample. The x-rays are detected by an energy sensitive semiconductor device, and the data are processed by an on line computer. A total of 76 elements heavier than aluminum were identified from 6200 samples. Atomic absorption was used for sodium analysis. Excellent detection limits (0.1 to 100 ppb) were obtained for most elements heavier than silicon. Cost per sample in this project was $42.60, but with improvements to this particular accelerator, quality analyses for 20,000 samples per year could be provided at an approximate cost reduction of 50% per sample. (Davison-IPA)

ARSENIC DETERMINATION BY THE SILVER DIETHYLDITHIOCARBAMATE METHOD AND THE ELIMINATION OF METAL ION INTERFERENCE,
Claflin Coll., Orangeburg, SC.
S. S. Sandhu.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 153, Price codes: A03 in paper copy, A01 in microfiche. Report No EPA-600/4-78-038, July 1978. 36 p, 7 fig, 5 tab, 22 ref. R 804164-01.

Descriptors: *Pollutant identification, *Water analysis, *Laboratory tests, *Chemical interference, *Arsenic, *Ions, Color reactions, Chemical analysis, Potable water, Waste water, Organic compounds, Trace metals, Inorganic compounds, Anion exchange, Water quality, Water chemistry, Distillation.

Data resolving the confusion surrounding the extent of ion interference in the determination of arsenic in water and waste water using the silver diethyldithiocarbamate (SDDC) method is presented. The standard procedure, with minor variations, was used for this study. Micro amounts of arsenic were recovered in the presence of the interferring ions, chromium (IV), cobalt (II), copper (II), molybdenum (VI), and nickel (II). The metal ions did not appear to interfere in the generation of arsine for concentrations of 5.0 mgL-1 and under. A significant positive interference in arsenic-SDDC color development and measurements was shown by antimony (III) concentrations of 0.3 mgL-1 or above, and mercury (II) concentrations of 1.5 mgL-1 or above. Organically bonded arsenic was successfully released by the potassium permanganate digestion method before its determination by SDDC. It was found that the distillation method was unsatisfactory for concentrating and isolating arsenic from interfering ions in synthetic dilute aqueous solutions and natural water before determination by SDDC. The anion exchange method was effective for eliminating the interferring ions, but arsenic recovery decreased in the presence of high concentrations of antimony in polluted water. However, recovery was improved by an increase in the amount of resin used in the chromatographic column. (Davison-IPA)

PROCEEDINGS OF THE SECOND WORKSHOP ON SAMPLING GEOTHERMAL EFFLUENTS.
Report No. EPA-600/7-78-121, June 1978. Workshop held in Las Vegas, Nevada, February 15-17, 1977. 256 p, 79 fig, 22 tab, 98 ref. 68-03-2468.

Descriptors: *Geothermal studies, *Analytical techniques, *Effluents, *Sampling, *Geochemistry, Pollutants, Monitoring, Standards, Water analysis, Soil analysis, Methodology, *Conferences, Publications, Abstracts, Information exchange.

A compilation of 17 papers, and abstracts of 14 others, presented at the second in a series of workshops on sampling and analysis of geothermal effluents is provided. The purpose of the workshop was to continue the exchange of ideas and knowledge introduced at the first workshop held in October 1975. It is intended that an acceptable set of standard geothermal effluent and analysis methods will eventually be developed from this series of workshops. Papers presented cover techniques and devices for sampling and measuring gases, soils, and water associated with geothermal areas, interpretation of results of sampling, and data from various specific areas. MERCURY, LEAD, ARSENIC, AND CADMIUM IN BIOLOGICAL TISSUE. THE NEED FOR ADEQUATE STANDARD REFERENCE MATERIALS,
Environmental Monitoring and Support Lab., Las Vegas, NV.
W. F. Beckert.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 198, Price codes: A04 in paper copy, A01 in microfiche. U.S. Environmental Protection Agency, EPA-600/4-78-051, 68 p, August 1978. 2 fig, 12 tab, 1 app, 221 ref.

Descriptors: *Mercury, *Lead, *Cadmium, *Arsenic compounds, Toxicity, Mortality, Analytical techniques, Chemical analysis, Path of pollutants, Heavy metals, Plant physiology, Animal physiology, Fish physiology, *Arsenic, *Bioaccumulation, *Tissue analysis, *Carcinogens, *Mutagens, Reference standards.

The present situation of standard reference materials consisting of plant and animal tissues is exam-

ined. A brief literature review presents a cross-section of published data on the incorporation of mercury, lead, arsenic, and cadmium into plant and animal tissues. It points out the wide concentration ranges of these elements that are encountered in biological tissue samples under environmental and experimental conditions. These concentration ranges are compared with the individual values of the corresponding elements as determined for the biological standard reference materials presently available from the National Bureau of Standards. The conclusion is reached that there is a need for the preparation of additional biological reference materials encompassing wide concentration ranges of the elements of interest. (EIS-Deal)

THE SELENASTRUM CAPRICORNUTUM PRINTZ ALGAL ASSAY BOTTLE TEST EXPERIMENTAL DESIGN, APPLICATION, AND DATA INTERPRETATION PROTOCOL,
Corvallis Environmental Research Lab., OR.
W. E. Miller, J. C. Greene, and T. Shiroyama.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 950, Price codes: A07 in paper copy, A01 in microfiche. Report EPA 600/9-78-018, July 1978, 126 p, 21 fig, 12 tab, 184 ref.

Descriptors: *Algae, *Nutrients, *Methodology, *Laboratory tests, Metals, Toxicity, *Eutrophication, Laboratory equipment, Nitrogens, Phosphorus, Algal control, Experimental design, Nutrient limitation, Heavy metal toxicity, *Selenastrum, Algal assay forms.

This document is the product of intensive research to improve and expand the understanding of results obtained from the Algal Assay Procedure: Bottle Test (USEPA 1971) to enable investigators to define the stimulatory and/or inhibitory interactions of municipal, industrial and agricultural wastes upon algal productivity in natural waters. This research was designed to determine the impact of nutrients and/or changes in their loading upon algal productivity; whether the growth response of Selenastrum capricornutum reflects the response of indigenous species; the feasibility of the assay test protocol to evaluate heavy metals; the capability of the assay to define the effect(s) of complex wastes; and if the assay information can be applied to define and assist in the management of real-world situation. As a result of these research efforts the Selenastrum capricornutum Printz Algal Assay Bottle Test: Experimental Design, Application and Data Interpretation Guide is offered now for wider application in both eutrophication and toxicity problem areas. LOWER SANTEE RIVER ENVIRONMENTAL QUALITY STUDY; AN ASSESSMENT OF SELECTED BIOLOGICAL AND PHYSICAL PARAMETERS.
South Carolina Water Resources Commission, Columbia.
Report No 122, Estuarine Studies, February 1976. 60 p, 9 fig, 4 tab, 7 ref, 1 append. Nelson, F.P. (editor)

Descriptors: *Santee River(SC), *Baseline studies, *Water quality, *Basic data collections, Mammals, *Aquatic plants, South Carolina, Rivers, Diversion, Dissolved oxygen, Biochemical oxygen demand, Nitrogen, Estuaries, Macrophytes, Floral lists, Faunal lists, Hydrology, Water chemistry, Phytoplankton, Algae, Crawl Creek(SC), Small animals(Mammals).

The Lower Santee River Environmental Quality Study (South Carolina) was originally intended as a hydrobiological baseline for evaluation of future changes (in particular a proposed river flow diversion), but several projected study inputs were not completed. This report includes: (1) a summary of findings and conclusions, (2) a report on water quality (1974-75), (3) a vascular plant survey (1974), and (4) a small mammal survey (1974-75). Tabular data include plant and animal species lists, measurements, and abundance, and 15 water quality parameters: water temperature, DO, BOD5, pH, specific conductance, color, turbidity, ammonia, nitrate, nitrite, Kjeldahl nitrogen, phosphorus, fecal coliforms, pesticide residues, and silicon dioxide. Data generally show lower water quality at Crawl Creek, but the pollutant is rapidly diluted or assimilated below the creek's confluence with the Santee. Only the Crawl Creek station had oxygen sag, which with BOD and other parameters indicated waste loading to the creek. Turbidity was low at all upstream stations, but doubled below Wambaw Creek due to suspended materials from the creek plus seawater influence. The Lower Santee is notable for faunal richness and scenic beauty. (Lynch-Wisconsin)

CONTINUOUS SIMULATION OF NONPOINT POLLUTION,
Ramlit Associates, Berkeley, CA
Y. J. Litwin, and A. S. Donigian, Jr.
Journal of the Water Pollution Control Federation, Vol. 50, No. 10, October 1978, p. 2348-2361. 9 fig, 26 ref.

Descriptors: *Nonpoint pollution, *Simulation analysis, *Water pollution sources, *Computer models, *Nonpoint source model, *Urban runoff, *Planning, *Land use, Model studies, Pollutants, Algorithms, North Carolina, Wisconsin, Washington, Third Fork Creek Basin(NC), Manitou Way Storm Drain Watershed(Madison WI), Benaroya Industrial Park Drainage Basin(South Seattle WA), Sedimentation, Runoff, Storm drains, Streams, Watersheds(Basins), Continuous simulation.

Test application of the Nonpoint Source Pollutant Loading Model (NPS) to three urban watersheds demonstrate that continuous simulation of sediment accumulation, generation, and transport by overland flow provides a viable means of assessing land surface contributions of nonpoint pollutants. The model in a single operation can stimulate nonpoint source pollution from five different land use categories. In addition to runoff, water temperature, DO, and sediment, the model simulates up to five user-specified pollutants. Model outputs can provide long-term continuous information on nonpoint pollution that can be used to establish the probability and frequency of occurrence of pollutant loadings under various land use configurations as a basis for evaluating the water quality impact of land use and policy decisions. Main limitations stem from simplification of the processes controlling nonpoint pollution, and the need to calibrate certain model parameters when applying the model to a watershed. When calibrated, the model can be used effectively to evaluate the impact of land use changes, regulations, and proposed plans. The NPS model was tested on the 433-ha Third Fork Creek Basin in Durham, North Carolina, the 60-ha Manitou Way Storm Drain Watershed in Madison, Wisconsin, and the 11.1-ha Benaroya Industrial Park Drainage Basin in South Seattle, Washington. MONTHLY OXYGEN AND CARBON BUDGETS OF THE NEW YORK BIGHT APEX,
Lamont-Doherty Geological Observatory, Palisades, NY
C. Garside, and T. C. Malone
Estuarine and Coastal Marine Science, Vol. 6, No. 1, January 1978, p. 93-104, 3 fig, 3 tab, 24 ref. NOAA 03-4-043-310, 04-6-022-44022

Descriptors: Environmental effects, *Energy budget, *Oxygen, *Carbon, Salinity, Temperature, Seasonal, Respiration, Primary production, Benthos, Water pollution sources.

This paper uses the distribution of primary production, salinity, temperature, dissolved oxygen and particulate organic carbon (POC) to establish monthly oxygen balances for the Apex of the New York Bight. The major source of POC was in situ primary production which was accompanied by high evasive surface oxygen flux and generally by higher levels of water column respiration. A major factor controlling benthic respiration was temperature. A lesser factor was resuspension of substrate material as a result of high runoff. It was concluded that major organic loading events resulting from this river runoff could result in small anoxic regions near the estuary. (Chilton-ORNL)

AN EXPERIMENTAL ASSESSMENT OF HALOGENATED ORGANICS IN WATERS FROM COOLING TOWERS AND ONCE-THROUGH SYSTEMS,
Oak Ridge National Lab., TN
R. L. Jolley, W. W. Pitt, Jr., F. G. Taylor, Jr., S. J. Hartmann, and G. Jones, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as CONF-771070-2, Price codes: A02 in paper copy, A01 in microfiche. CONF-771070, Gatlinburg, Tennessee, October 31-November 4, 1977. 13 p, 3 fig, 4 tab, 14 ref.

Descriptors: *Water pollution sources, *Air pollution, *Cooling water, *Cooling towers, Powerplants, Reactors, Chlorination, Organic compounds, Tennessee, Oak Ridge, Kingston Steam Plant.

In this assessment three cooling systems were studied: the cooling tower systems at Oak Ridge Gaseous Diffusion Plant the High Flux Isotope Reactor at Oak Ridge, and the once-through cooling system of the Kingston Steam Plant in Tennessee. Analysis of chlorinated water samples from these sources revealed the presence of numerous nonvolatile uv-absorbing and cerate-oxidizable constituents and it was suggested that these are probably chloro-organics. Chloroform, bromodichloromethane, dibromochloromethane, and bromoform are formed during the chlorination of cooling waters in both closed-cycle and once-through systems. The major portion of the chloroform, bromomethanes and bromoform are rapidly lost to the atmosphere. Data showed that the amount of chloroform lost from the ORGDP and the HFIR totaled more than a ton annually. (Chilton-ORNL)

EVALUATION OF VINYL CHLORIDE EMISSIONS IN THE LONG BEACH AREA, CALIFORNIA,
National Field Investigations Center-Denver, CO.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 642, Price codes: A03 in paper copy, A01 in microfiche. Report No. EPA-330/2-74-002, May 1974. 44 p, 11 fig, 4 tab, 3 append.

Descriptors: *Pollutant identification, *Vinyl chloride, *Water pollution, *Air pollution, *Industrial wastes, Effluents, Water pollution sources, Hazards, Waste treatment, Sampling, Sludge, American Chemical Corporation, B.F. Goodrich Chemical Company, Long Beach, California, Surveys, Toxicity, Public health.

A survey of vinyl chloride emissions was conducted at the American Chemical Corporation and

B.F. Goodrich Chemical Company in Long Beach, California. It was found that vinyl chloride monomer (VCM) was being emitted from the plants via water, sludge, and air. An estimated five lbs/day leave the B.F. Goodrich plant and 22 lbs/day leave the American Chemical plant in the waste water effluents. Evaluations for both plants are presented, major waste water sources are identified, and plant waste water treatment systems are described. The sampling program consisted of waste water samples taken from three sampling stations at B.F. Goodrich and seven stations at American Chemical; grab samples of ambient air were taken from 15 locations surrounding the plant and analyzed with the Wilks Scientific MIRAN Portable Gas Analyzer. On site release of VCM to the air during venting, cleaning or by accident, was monitored by infrared spectrometer. Indications are that these plants will be routinely in violation of the standard proposed by the Occupational Safety and Health Administration for employee exposure level. (Davison-IPA)

PARAQUAT SORPTION AS A FUNCTION OF PARTICLE SIZE IN NATURAL SEDIMENTS,
Environmental Research Lab., Athens, GA.
S. W. Karickhoff, and D. S. Brown.
Journal of Environmental Quality, Vol. 7, No. 2, p 246-252, April-June, 1978. 1 fig, 6 tab, 13 ref, 9 equ.

Descriptors: *Paraquat, *Sorption, Adsorption, Particle size, Pesticides, Pollutants, *Sediments, Isotherms, Cation exchange, *Clay mineral.

The distribution of sorbed paraquat as a function of particle size (sand through clay) was determined on five natural sediments. Paraquat concentrations in individual size fractions varied as much as two orders of magnitude within a given sediment, showing a pronounced preference for the fine silt and clay fractions. Adsorption isotherms were measured for individual size separates on one sediment. Paraquat distributions in the whole sediment agreed well with those computed using the isotherm coefficients determined on individual size separates. Paraquat sorbs by ion exchange, and sorption partition coefficients showed a definite correlation with the cation exchange capacity (CEC) of individual size fractions. However, exchange sites in different fractions differed in their effectiveness in sorbing paraquat, with the fine silt and clay exchange sites being more effective than those of the larger separates. In pure clay suspensions (hectorite and montmorillonite), sorbed paraquat did not distribute uniformly throughout the clay particle size range. It was concluded that for highly sorbed compounds such as paraquat, conventional phase separation techniques for measuring sorption may not distinguish sorbed vs. 'free' compounds. POLLUTION PROFILE OF A RIVER,
Bhabha Atomic Research Centre, Bombay (India). Health Physics Div.
A. D. Paul, and K. C. Pillai.
Water, Air and Soil Pollution, Vol. 10, p. 133-146, 1978. 6 fig, 7 tab, 9 ref.

Descriptors: *Radioisotopes, *Thallium radioisotopes, Uranium radioisotopes, Rivers, River flow, Industrial wastes, Chemical wastes, Water quality, Water chemistry, Sediment transport, Chemical analysis, Acids, Salts, Metals, Path of pollutants, Suspended solids, Deposition(Sediments), Sedimentation, Water Pollution sources, *Periyar River(So India), *India.

A host of chemical industries subject the Periyar River (India) to pollutants such as acids, alkalies and their salts, trace metals and radionuclides belonging to the Th and U chains. Proximity of different outfalls and poor lateral mixing in the river are responsible for high local aquatic concentrations. Scavenging reactions, in situ, and sedimentation of suspended matter result in the accumulation of radionuclides near the outfall area. The monsoon 'flushes out' the river into the backwater area. Translocation of sediments is the major factor in the transport of pollutants. (EIS-Deal)

REGULATION OF COPPER AVAILABILITY TO PHYTOPLANKTON BY MACROMOLECULES IN LAKE WATER,
Eidgenoessische Anstalt fuer Wasserversorgung, Abqasserreinilgung und Gewaesserschutz, Zurich (Switzerland).
R. Gachter, J. S. Davis, and A. Mares.
Environmental Science and Technology, Vol. 12, No. 13, p 1416-1421, 1978. 7 fig, 2 tab, 27 ref.

Descriptors: *Coppe, *Phytoplankton, *Filtration, Lakes, Filters, Membranes, Photosynthesis, Physiology, Metabolism, Bioassay, Chemical analysis, Water chemistry, Water analysis, Toxicity, Metals, Path of pollutants, Copper compounds, *EDTA, *Ligands.

Approximately two-thirds of the copper in lake water remains in the nonfilterable residue of the following two-step procedure: 0.45 Micro m filtration followed by Diaflo UM-2 membrane (passing mol wt 1000) ultrafiltration. Examination of the effect of this residual copper on the photosynthesis rate of natural phytoplankton has shown that this residual copper is physiologically not available to the organisms. This fact can be utilized in a bioassay (as demonstrated with EDTA as a test substance) to gain information on the concentration of a ligand and its apparent association constant with copper. It is concluded that nonultrafilterable ligands present in lake water form copper complexes as stable as the CuEDTA complex and can thus play an ecologically significant role in the regulation of copper availability and therefore its toxicity to phytoplankton. FACTORS AFFECTING ATRAZINE ADSORPTION, DEGRADATION AND MOBILITY IN SOIL,
Nebraska Univ., Lincoln. Dept. of Agronomy.
T. H. Dao.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 575, Price codes: A05 in paper copy, A01 in microfiche. Ph.D. Dissertation, May 1977. 68 p, 11 fig, 11 tab, 29 ref. OWRT B-030-NEB(5). 14-34-0001-5087.

Descriptors: *Herbicides, *Adsorption, Leaching, Water quality, *Atrazine, *Leaching, *Degradation(Decomposition), *Path of pollutants, Soils.

Experiments were conducted to study the process of adsorption, degradation and leaching of atrazine and the interrelationship of these processes in soil. Adsorption isotherms for atrazine were described by the Freundlich equation. Decrease in water:soil ratio, from 5:1 to 0.4:1 and in soil moisture content, from 0.1 to 0.3 bar moisture content led to an increase in adsorption of atrazine on soil. Increasing the concentration of electrolyte added to soil increased atrazine adsorption by reducing the solubility of the herbicide in solution. Increasing soil temperature from 5C to 30C increased atrazine adsorption on soil. This endothermic reaction was observed both before and after correction for differential atrazine solubility due to temperature. Thermodynamic quantities associated with the adsorption reaction were calculated to characterize the adsorption of atrazine on soil. Simultaneous degradation and fixation occurred during the leaching of atrazine through soil with 30 cm of water. Decreasing the water flow rates from 2 cm/hr to 1 cm/day greatly reduced the mobility of atrazine in saturated soil columns. The contribution of the diffusion process to the overall movement of atrazine in soil was estimated to be small. The diffusion coefficients of atrazine in saturated soils were in the order of 0.2 to 1.1 x 10-7 cm2/sec.

ADSORPTION AND DESORPTION IN MINE DRAINAGES,
Colorado School of Mines, Golden.
L. J. Holcombe.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 614, Price codes: A06 in paper copy, A01 in microfiche MS Thesis (1977). 98 p. OWRT A-034-COLO(2) 14-34-0001-7012.

Descriptors: *Adsorption, *Desorption, *Sediment deposition, *Mineralization, Water quality, *Mine drainage, *Colorado mineral belt, Model studies, *Heavy metals, Water chemistry, Ion exchange.

In this report is analyzed the solid sediment deposited in a mine drainage and its effect on the solution chemistry; specifically, the adsorption of heavy metals by the hydrous oxides of manganese and iron. Forty-two sediment samples were collected from mine drainages in the Front Range and sieved to minus eighty mesh. A selective chemical attack on the sediments with a hydroxylamine hydrochloride and acetic acid mixture showed that manganese oxides controlled the amount of Co, Cu, Cd, Zn and Ni in the sediment. Hydrous oxides of iron, did not adsorb metals from solution and had a negative correlation with Mg, Al, Ca, Na, K, Cu, Pb, Ni, Mn, Zn, Co, and Cd. The sorption behaviors of manganese and iron hydrous oxides are strongly controlled by pH. At the low pH's of the mine drainages, iron oxides have a positive surface charge, thus preventing the adsorption of cations; manganese oxides have a negative surface charge at these pH's. Through the extraction method it was found that a large portion of the mine drainage sediments are adsorbed or precipitated material, the exact percentage being dependent on pH, Eh, complexing agents, stream flow, sediment distribution co-efficients and other factors. A model was designed and tested which will enable an experimentor to determine the distribution or isotherm for a metal between its aqueous form and as asorbed species. The isotherm method involves equilibration of a metal in solution with complexing agents and ion-exchangers, with subsequent determination of all forms of the metal. The ion-exchange method was used to determine the free metal and complexed metal concentrations in solution. Under ideal laboratory conditions, using synthetic exchangers and controlled solution parameters, the isotherm method was accurate in determining the 'true' isotherm for Zn(II) when citrate was present as a complexer.

THE EFFECT OF HIGH 2, 4-D CONCENTRATIONS ON DEGRADATION AND CARBON DIOXIDE EVOLUTION IN SOILS,
Florida Univ., Gainesville. Dept. of Soil Science; and Florida Univ., Gainesville. Dept. of Food Science and Human Nutrition.
L-T. Ou, D. F. Rothwell, W. B. Wheeler, and J. M. Davidson.
Journal of Environmental Quality, Vol. 7, No. 2, p. 241-246, April-June, 1978. 6 fig, 6 tab, 13 ref.

Descriptors: Pesticides, *Herbicides, *Pesticide residues, Persistence, *Microbial degradation, Pesticide toxicity, Carbon dioxide, Waste disposal, *2,4-D.

A laboratory experiment was conducted to determine the degradation of high concentrations of 2,4-D (2,4-dichlorophenoxyacetic acid) and CO2 evolution in three soils. Two forms of 2,4-D, technical grade and formulated, were added to each soil at rates of 50, 500, 5,000 and 20,000 micrograms/g of soil (ppm). Degradation of the 2,4-D was measured by 14CO2 evolution resulting from the oxidation of uniformly ring-labeled carbon. At an application rate of 500 ppm, all three soils degraded 2,4-D. At 5,000 and 20,000 ppm, degradation occurred in the Webster silty clay loam and Terra Ceia organic soil, but not in the Cecil sandy loam during 80 days of incubation. The degradation rate was generally higher for the formulated 2,4-D than the technical grade material. For the higher 2,4-D concentrations, 5,000 or 20,000 ppm, when extensive degradation occurred, total CO2 evolution was also greatly stimulated, and the pattern of total CO2 evolution rate exhibited a two-peak response. Carbon dioxide-carbon (CO2-C) from the first peak appeared to be mainly from the formulation materials or from the impurities and CO2-C from the second peak was mainly from 2,4-D-C. (Skogerboe-Colorado State)

EFFECT OF SOIL MOISTURE CONTENT UPON ADSORPTION AND MOVEMENT OF PHOSPHORUS FROM LEACHATES OF DOMESTIC WASTE DISPOSAL SYSTEMS,
Maine Univ. at Orono.
T. G. McNeice
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 561, Price codes: A04 in paper copy, A01 in microfiche. MS Thesis, August 1978. 74 p, 21 fig, 3 tab, 54 ref. OWRT A-044-ME(1)

Descriptors: Porous media, Hydraulic properties, Soils, Septic tanks, *Adsorption, *Soil moisture, *Phosphorus, Organic matter, Saturation, Penetration, *Moisture content, Waste water disposal fields, *Leachates, Path of pollutants, Adams soil, Soil columns, Phosphorus adsorption.

Physical principles of porous media flow were used to establish functional relationships between hydraulic properties of an Adams soil. Soil columns simulating septic tank adsorption fields were used in conjunction with the hydraulic property data to investigate effect of soil moisture content upon the adsorption and movement of phosphorus. Experimental tests were employed to determine other factors such as pH and organic matter content specific to the Adams soil, which could effect phosphorus retention. It was demonstrated that the effect of reducing the level of saturation in a soil is to greatly increase the amount of phosphorus adsorbed and thereby limit the depth of penetration.
W79-03683

MEASUREMENT OF THE ENGINEERING PROPERTIES OF MUNICIPAL INCINERATOR RESIDUES AND CONSIDERATION OF LEACHATE CHARACTERISTICS,
Connecticut Univ., Storrs
G. G. Jillson
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 675, Price codes: A05 in paper copy, A01 in microfiche. MAster of Science Thesis, 1976. 92 p, 29 fig, 14 tab, 2 append, 14 ref. OWRT A-67-CONN(3), 14-31-0001-6007.

Descriptors: *Incineration, *Sewage sludge, *Leachate, *Waste disposal, *Landfills, *Municipal wastes, *Incinerator residue, *Solid wastes, Hydraulic properties, Mechanical properties, Batch feed solid waste incinerator, Continuous feed sewage sludge incinerator.

The hydraulic and mechanical properties of incinerated municipal solid waste and incinerated sewage sludge were measured. The specific tests carried out were: Standard Proctor density, saturated permeability, triaxial strength and one-dimensional strength tests. These tests were performed on samples from a batch feed solid waste incinerator, a continuous feed solid waste incinerator and a continuous feed sewage sludge incinerator. The results indicated that all three types of incinerator ash are a stable, lightweight fill material that when compacted could be used as landfill cover in recreational areas or any other use that does not require high strength or stiffness. The permeability of the compacted ash is high enough to allow infiltration of 90% of the rain that falls on it if the water table is below the surface. If the leaching of chemicals is to be prevented, the ash must be kept dry by an impervious cover or be placed in a pit lined with an impervious material.

METHODOLOGIES OF EXAMINING POLLUTION FROM URBAN RUNOFF,
Rutgers - The State Univ., New Brunswick, NJ Dept. of Civil and Environmental Engineering
J. M. DiLouie.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 595, Price codes: A07 in paper copy, A01 in microfiche M.S. Thesis, October 1978, 120 p. 50 fig, 18 tab. OWRT A-046-NJ(3), B-059-NJ(2), B-063-NJ(2), 14-34-0001-5128, 7124.

Descriptors: *Urban runoff, *Storm runoff, *Rainfall intensity, *Antecedent precipitation, *Pennsylvania, *New Jersey, Chemical oxygen demand, Biochemical oxygen demand, Suspended solids, Phosphates, Nitrates, Ammonia, Pollutant loadings.

This thesis is addressed to the methodologies of examining urban storm water runoff data by investigating relationships between the pollutant loading from each storm event and criteria such as runoff, the number of days since the last significant rainfall, and rainfall intensity. Sampling sites were located in North Philadelphia, Pennsylvania; and Trenton, Hamilton Township and East Windsor in New Jersey. Pollution parameters of concern for this paper are limited to nitrate expressed as nitrogen, suspended solids, chemical oxygen demand, 5-day BOD, total phosphates expressed as total phosphorus, and ammonia expressed as nitrogen. During the period of 6/1/76 to 10/1/77, 28 storm events were sampled. There appears to be some type of positive correlation between the pollutant loadings examined and the amount of runoff. However, the correlation is different for each site. In the realm of days since last significant rainfall versus pollutant loadings, no significant, outstanding, or consistent relationships were found, implying that there may be no basis to this concept. In general, the greater the intensity, the greater the pollutant loading. This was most strongly exhibited in the parameter of COD. The remaining parameters, except suspended solids, showed this tendency also.

MOTORBOAT USE ON THE WILD ROGUE RIVER: AN INVESTIGATION OF USE BETWEEN WATSON CREEK AND BLOSSOM BAR,
Oregon State Univ., Corvallis. Dept. of Geography.
P. E. Donheffner, and K. W. Muckleston.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 593, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Research Institute, Oregon State University Report WRRI-52, December 1976. 60 p, 6 fig, 8 tab, 7 append. OWRT A-999-ORE(21)

Descriptors: *Recreation, *Motorboat pollution, River recreation, Riverine planning, *Wild Rouge River(Ore), *Oregon, Water utilization, Monitoring.

A study of private motorboat use on the lower nine miles of the Wild Rogue River was conducted to determine present and historical use levels. Motorized use was monitored daily, and a survey of private motorboaters undertaken using personal interviews. There is a long history of motorboat use in the study area; it was well established by 1968 when part of the Rogue was designated as a Wild River. All types of motorized use have increased since then, especially commercial and administrative use. Private use in 1976 is estimated at 1,000 trips, not all of which were recreational. There is considerable variation in the spatial and temporal patterns of use; over 30 percent of all private use takes place in September and October. Fishing is the primary reason for private motorboat use. The greatest problem reported by private motorboaters was discourtesy by downriver, drift users.

FATE OF 2, 4-D IN A NAFF SILT LOAM SOIL,
Nebraska Univ. Panhandle Station at Scottsbluff
R. G. Wilson, Jr., and H. H. Cheng
Journal of Environmental Quality, Vol. 7, No. 2, p. 281-286, April-June, 1978. 3 fig, 4 tab, 16 ref.

Descriptors: *Adsorption, *Hydrolysis, *Chemical degradation, *Microbial degradation, Weed control, *2,4-D, Herbicides.

Laboratory studies were conducted to determine the adsorption, desorption, hydrolysis, and breakdown of commercially formulated isooctyl ester and dimethylamine salt of (2,4-dichlorophenoxy) acetic acid (2,4-D) in a Naff silt loam soil. More 2,4-D was adsorbed to the surface soil than to soil at lower depths, and the percentage of 2,4-D adsorped decreased as the total amount of 2,4-D present increased. Formulated 2,4-D isooctyl ester applied to moist soil underwent hydrolysis to the anionic form at a rapid rate, with less than 80 percent of the ester hydrolyzed in 72 hours. High amounts of 2,4-D in runoff (sediment and water) retarded the active degradation of carboxyl-14C 2,4-D when 2,4-D was incubated in runoff from a wheat field treated with various formulations and rates of 2,4-D. The presence of the ester formulation at the high rate of application increased the lag period before degradation of carboxyl-14C and ring-14C 2,4-D occurred in soil. However, once the active breakdown of carboxyl-14C and ring-14C 2,4-D was initiated, little difference could be detected in the degradation patterns. At the end of the 10 weeks of incubation in runoff or in soil, only 1 percent of the 14-C 2, 4-D originally applied to the soil could be identified as 2,4-D. (Skogerboe-Colorado State)

COMPARATIVE STUDY OF TOXICITY, UPTAKE AND DISTRIBUTION OF CADMIUM AND MERCURY IN THE SEA WATER ADAPTED EEL ANQUILLA ANQUILLA,
Liege Univ. (Belgium). Lab. d'Oceanologie.
F. Noel-Lambot, and J. M. Bouquegneau.
Bulletin of Environmental Contamination and Toxicology, Vol. 18, No. 4, p. 418-424, 1977. 1 fig, 1 tab, 26 ref.

Descriptors: *Mercury, *Cadmium, *Toxicity, Mortality, Spectrophotometry, Absorption, Membrane processes, *Eels, Lethal limit, Permeability, Path of pollutants, Animal metabolism, Chlorides, Metals, Tissue analysis, Bioaccumulation, Anquilla, Gills.

Toxicity test results show that eels are much more susceptible to HgCl2 exposure than to CdCl2 exposure. In terms of tissue distribution, maximum concentrations were attained in the kidneys in both cases. Next came the digestive tract and the liver in the case of Cd, the spleen, the gills and the liver in the case of Hg. When result were expressed as organ metal load compared to whole body content, the digestive tract, kidneys, and liver contained 56% of the total Cd, while 66% of the total Hg was concentrated in the muscles. A CONCEPTUAL MODEL FOR THE MOVEMENT OF PESTICIDES THROUGH THE ENVIRONMENT: A CONTRIBUTION OF THE EPA ALTERNATIVE CHEMICALS PROGRAM,
National Ecological Research Lab., Corvallis, OR.
J. W. Gillett, J. Hill, IV, A. W. Jarvinen, and W. P. Schoor.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-238 653, Price codes: A05 in paper copy, A01 in microfiche. Report No EPA-660/3-74-024, December 1974. 86 p, 21 fig, 42 ref. 1EA487.

Descriptors: *Model studies, *Ecosystems, *Pesticides, Pesticide drift, Pesticide kinetics, Pesticide residues, Movement, Path of pollutants, Food chains, Theoretical analysis, Systems analysis.

A conceptual model of the movement and disposition of pesticides in the environment is developed in order to permit judicious collection and evaluation of data at the critical points in that disposition. It is the first step in organizing facts, assumptions, and hypotheses into a logical, graphic array which can ultimately be exploited through the use of systems analysis and mathematical simulation techniques to evaluate the fate of a specific chemical in a particular environment. A graphic model is built up from simple modules representing basic processes and components of air, flora, fauna, soil and water, as well as mechanisms of disposition such as convective mass transport, interparticle diffusion, co-distillation, condensation, intra-particle diffusion, ingestion, adsorption/desorption, chemical transformation, and biological alteration. These elements were used in the development of more specific models for the atmospheric/terrestrial, freshwater aquatic and estuarine/marine environments. While the concept of a model with global validity was rejected, the commonalities of the basic processes and components in these environments was emphasized, and it was suggested that through iterative operations of expansion and systematic reduction of processes and components, these environments could be joined to provide a holistic view of a chemical's disposition and effects. (Luedtke-Wisconsin)

THE BEHAVIOR OF NUTRIENT ELEMENTS ADDED TO A FOREST SOIL WITH SEWAGE SLUDGE,
Washington Univ., Seattle. Center of Ecosystem Studies.
H. Riekerk.
Soil Science Society of America, Vol. 42, No. 5, p 810-816, September-October 1978. 5 fig, 1 tab, 23 ref.

Descriptors: *Sewage sludge, *Forest soils, *Nutrient removal, On-site investigations, Nutrients, Groundwater, Leaching, Rainfall, Nitrogen, Phosphorus, Potassium, Calcium, Anions, Cations, Ion exchange, Hydrogen ion concentrations, Groundwater movement.

Sludge applications were made at a rate of 247 metric tons/ha dry weight to a cleared gravelly Douglas fir forest soil to test limits of nutrient conservation mechanisms. First year losses due to treatments were 8% of added N, 15% of Ca, 1% of K, and none of P. Predictably, NO3-N was the dominant mobile anion significantly increasing the calcium nitrate level in the groundwater. Differences between sludge treatments, including plowing, reflected the degree of aeration and decomposition of NO3-N production and P-fixation. These differences were more pronounced deeper in the soil, except for K which was more controlled by the stage of weathering. A very heavy sludge application rate (618 metric tons/ha) had less impact on soil nutrient behavior due to a high water absorption capability. Alternate ways of reducing NO3-N leakage from the forest soil are being investigated. (Sims-ISWS)

POTENTIAL SOURCES OF ASBESTOS IN LAKE MICHIGAN,
Illinois Univ. at the Medical Center, Chicago. School of Public Health.
C. S. Hesse, and W. H. Hallenbeck.
Journal of Great Lakes Research, Vol. 4, No. 1, p 57-61, March 1978. 37 ref.

Descriptors: *Asbestos, *Lake Michigan, *Water pollution sources, Water pollution, Industries, Geology, Atmosphere, Currents(Water), Dredging, Pollutants, Path of pollutants, Lakes, Surveys.

Chrysotile and amphibole mineral fibers, recognized carcinogens, have been found in Lake Michigan water. Since the sources of these fibers in Lake Michigan are unknown, a study was undertaken to determine potential sources. Information was gathered by contacting governmental agencies and reviewing literature. Two industries that used to discharge asbestos-containing effluents are located in the Lake Michigan drainage basin. Geologic deposits of mineral fibers occur in Marinette County, Wisconsin, and the Upper Peninsula of Michigan. Currents and Army Corps of Engineers dredging and disposal activities were investigated as potential mechanisms of asbestos distribution in Lake Michigan. Limited environmental monitoring indicated that atmospheric loading and wash-out from numerous point and non-point sources may be an important mechanism of asbestos contamination of Lake Michigan. More environmental monitoring will be required in order to determine the relative importance of these potential sources. (Sims-ISWS)

MIREX IN THE SEDIMENTS OF LAKE ONTARIO,
Ontario Ministry of Agriculture and Food, Guelph. Pesticide Residue Lab.
M. V. H. Holdrinet, R. Frank, R. L. Thomas, and L. J. Hetling.
Journal of Great Lakes Research, Vol 4, No 1, p 69-74, March 1978. 2 fig, 4 tab, 12 ref.

Descriptors: *Pesticides, *Sediments, *Lake Ontario, Sampling, Surveys, Distribution patterns, Water pollution, Water pollution sources, Suspended solids, Chemical analysis, Insecticides, Rivers, Runoff, Lakes, Lake sediments, *Mirex.

Analysis of sediment samples collected in Lake Ontario in 1968 revealed the occurrence of mirex in two anomalous zones related to input from the Niagara and Oswego Rivers. These anomalies were confirmed in a 1976 resampling program. A suspended solids sample taken in the Niagara River confirmed an upstream source (Hooker Chemical) of the compound. Bottom sediment samples in the Oswego River identified an industrial source (Armstrong Cork) 14 km upstream of the river mouth. Known use of mirex by this plant indicated a substantial loss some 15 years ago. This was confirmed by sediment coring in the open lake sediments indicating that mirex deposition commenced 7 to 14 years before present. (Sims-ISWS)

A CASE STUDY-NITRATES IN THE UPPER SANTA ANA RIVER BASIN IN RELATION TO GROUNDWATER POLLUTION,
California Univ., Davis. Dept. of Land, Air and Water Resources.
R. S. Ayers.
In: National Conference on Management of Nitrogen in Irrigated Agriculture, p. 355-367, 1978. 2 fig, 1 tab, 4 ref.

Descriptors: *Nitrates, *Nitrogen, Water management(Applied), Fertilization, Waste disposal, Pollutant identification, *California, *Santa Ana River(Calif), *Groundwater, Water pollution.

In response to a request from the Santa Ana Watershed Planning Agency (a regional planning agency) the Kearney Foundation of Soil Science of the University of California conducted an interdisciplinary 3-month study of the nitrate problem in the Basin. The study was limited to the upper part of the basin where nitrate degradation of waters was more serious. The study included (1) a review of available data to identify existing areas of high nitrate concentrations in underground waters, (2) a review of past land use, water and fertilizer use and waste disposal practices, and (3) estimates of the impact of irrigation, fertilization and use of animal wastes on leaching of nitrate from root zones. Guidelines for the use of water, fertilizers and manures were developed. (See also W79-03941) (Skogerboe-Colorado State)

PCBS: THEIR ENVIRONMENTAL SIGNIFICANCE AND DISTRIBUTION IN RHODE ISLAND,
Rhode Island Univ., Narragansett. Coastal Resources Center.
A. J. Paulson, and D. T. Brown.
Sea Grant Program, Marine Technical Report No. 68, July 1978. 29 p, 2 fig, 6 tab, 44 ref

Descriptors: *Polychlorinated biphenyls, *Water pollution sources, *Toxicity, Chemistry, Rhode Island, Landfills, Waste disposal, Path of pollutants, Water quality control.

Summary information on PCB chemistry, sources, transport mechanisms, and toxicity, with focus on the marine environment is provided. The existing data on PCBs in Rhode Island are presented and assessed in the second part of the report. From this review and assessment the following conclusions can be made: PCBs, although present in the Rhode Island environment, are not a major pollution problem. Data on PCBs in Rhode Island ecosystems are scanty. Additional information would provide a clearer picture of PCB distribution but it is not considered to be of high priority, since the available data suggest that present levels are low. (NOAA)

OVERVIEW OF THE FRESH PACK FOOD INDUSTRIES.
SRI International, Menlo Park, CA.
L. R. Somogyi, and P. E. Kyle
Report No EPA-600/2-78-216, December 1978. 110 p, 10 fig, 22 tab, 27 ref. R804642-01.

Descriptors: *Industrial wastes, Agriculture, *Water pollution sources, *Foods, *Organic wastes, Water users, Effluents, Apples, Citrus fruits, Grapefruit, Fruit crops, Lemons, Lettuce, Onions, Potatoes, Vegetable crops, Salmon, Marine fish, Oysters, Nuts, Fresh foods, Eggs, Fresh produce, Waste disposal, Solid wastes, Organic wastes, Waste water(Pollution).

Substantial amounts of water are used, and organic wastes are produced during market preparation of most fresh fruits, vegetables, fish, and shell eggs. In assessing the pollution contributions of the fresh produce handling industry, the common unit operations applied after harvest, the water usage and waste disposal associated with the ten highest volume crops were reviewed. Two nut crops, two species of fish, and fresh eggs were included in the investigation because if their special handling requirements. It was found that although the industries are not a major source of air pollutants, they are major sources of solid wastes in the form of natural organic substances. Much of these wastes are returned to the field, or used as byproducts, fuel, or feed, with only small amounts handled in central locations where they may periodically create local problems when disposed to urban sewage systems. In addition to washing, cleaning water is used for transporting fruits through grading and inspection systems, and for cooling fresh fruits, fish, and vegetables. Large volumes of waste water containing various strengths of organic pollutants are created. Significant quantities of water are used in the market preparation of apples, oranges, lemons, and potatoes. The waste water contains some detergent compounds applied during the cleaning processes; cleaning water and cooling water are often treated with germicides. Chlorine is the most common germicide. Pesticide residues and potentially hazardous chemicals are used at very low concentrations, and are not likely to harm the environment. (Davison-IPA)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 790, Price codes: A04 in paper copy, A01 in microfiche. Report No. EPA-600/2-78-215, October 1978. 71 p, 4 fig, 19 tab, 12 ref, 2 append. 804642-01-2.

Descriptors: *Industrial wastes, *Tannery wastes, *Organic wastes, *Toxicity, *Waste water, Dyes, Biosorption, Effluents, Dye releases, Dye concentrations, Water pollution sources, Water pollution effects, Color, Waste water treatment.

A study of the organic dyes released to the environment in the waste waters from leather dyeing processes is reported. Acid, basic, direct, and metallized dyes are the dye types used by the leather industry, with acid and direct dyes used by the leather industry, with acid and direct dyes predominating. One plant can use as many as 100 dye formulations. Over 50 dyes have been identified as being used by tanneries; 49 of these are listed with structural formulas indicating the range of materials used. Most tanneries discharge their complex effluents directly into municipal sewers. The character of these waste streams is inconsistant because tannery operations are batch mode which very daily. Little information is available concerning the fate of the dyes released to the environment. The probable discharge of dyes in waste water is estimated based on information from suppliers and tanners. The most likely mechanism for biological removal of dyes in waste water treatment systems appears to be biosorption. The tanning industry structure, its processing operations, the types of raw materials required, the potential process sources of emissions to the environment, and environmental control practices are described. INVESTIGATION OF LANDFILL LEACHATE POLLUTANT ATTENUATION BY SOILS,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
W. H. Fuller.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 995, Price codes: A11 in paper copy, A01 in microfiche. Report No EPA-600/2-78-158, August 1978. 219 p, 41 fig, 104 tab, 91 ref, 5 append. 68-03-0208.

Descriptors: *Water pollution, *Groundwater, *Soil chemistry, *Leachate, *Soil permeability, Municipal wastes, Industrial wastes, Contamination(Soil), Solid wastes, Leaching, Arsenic, Beryllium, Cadmium, Copper, Chromium, Lead, Mercury, Selenium, Zinc, Iron, Clay, Lime, Iron oxides, Total organic carbon(TOC), Chemical oxygen demand(COD).

Because of the importance of soil and earth materials in retarding or preventing movement of pollut-

ants into groundwater, an investigation was made of the movement and retention of a variety of pollutants when they were carried by municipal solid waste leachate through soils. A laboratory study was conducted using 11 soils from 7 major orders throughout the U.S. and municipal landfill leachate alone, and spiked with pollutant metals in concentrations expected from highly polluted leachates of municipal and industrial wastes. Metals included arsenic, beryllium, cadmium, iron, mercury, nickel, lead, selenium, vanadium, and zinc. Attenuation of these substances was found to be a function of their individual properties, permeability of the soil, and the amounts of clay, lime, and hydrous iron oxides in soil. Amounts of elements retained by soils after extraction with water and 0.1 N HCl suggest that soils have substantial permanent retention capacity. Total Organic Carbon (TOC) and Chemical Oxygen Demand (COD) in unspiked leachates were not significantly retained by any soil. However, because of materials displaced from the soil, the COD in soil column effluents was initially 30 to 50 times higher than COD in the applied leachate, but rapidly decreased to the same level. TOC in soil column effluents rapidly increased to the level of TOC in the applied leachate; on subsequent leaching with water, essentially all applied TOC was eluted. Data obtained during testing were used to develop and partially validate a simulation model for predicting solute concentration changes during leachate flow through soils. (Majtenyi-IPA)

A CASE STUDY OF HAZARDOUS WASTES IN CLASS I LANDFILLS,
Southern California Univ., Los Angeles. Environmental Engineering Program.
B. Eichenberger, J. R. Edwards, K. Y. Chen, and R. D. Stephens.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-284 937, Price codes: A06 in paper copy, A01 in microfiche. Report No. EPA-600/2-78-064, June 1978. 114 p, 20 fig, 44 tab, 36 ref, 5 append. R-803813.

Descriptors: *Pollutant identification, *Oil wastes, *Landfills, *Chemical wastes, Soil contamination, Water pollution sources, Industrial wastes, Liquid wastes, Municipal wastes, Los Angeles, Hazards, Metals, Water pollution, Groundwater, Surface waters, Sodium, Iron, Calcium, Zinc, Potassium, Magnesium, Copper, Chromium, Nickel, Lead, Barium, Manganese, Vanadium, Cadmium, Arsenic, Beryllium, Silver.

A total of 320 waste samples were collected from five landfill sites in the Los Angeles area, and consolidated into 99 samples representative of 17 industrial types. The sites received an estimated combined daily volume of 2.3 x 10(6) l/day of hazardous wastes. The average daily deposition and partitioning of 17 metal species for all five sites were documented. The data were summarized for the six general industrial groups: petroleum, chemical, industrial cleaning, metal, food, and miscellaneous/unknown. The results indicate that copper, chromium, and zinc wastes present the greatest potential threat to groundwater and surface supplies in consideration of total mass deposition, weight percent in the soluble phase (42% to 86%) and maximum concentration levels (14,000 to 20,000 mg/l). The combined results for the five sites studied are considered to be representative of the hazardous stream generated in the greater Los Angeles area. (Davison-IPA)

FACTORS INFLUENCING THE VOLATILIZATION OF MERCURY FROM SOIL,
Environmental Monitoring and Support Lab., Las Vegas, NV.
R. D. Rogers, and J. C. McFarlane.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 179, Price codes: A02 in paper copy, A01 in microfiche. Report No EPA-600/3-78-054, May 1978. 19 p, 8 fig, 2 tab, 19 ref.

Descriptors: *Mercury, *Volatility, *Soil chemistry, *Soil microorganisms, *Soil amendments, *Soil physical properties, Soil texture, Evaporation, Soil sterilization, Clay loam, Loam, Microbial degradation.

The volatilization of mercury from amended soils, the rate of loss, the chemical and biological availability of mercury in soil, and whether such volatility is of a biological origin, was investigated. Two soils, a loamy sand a silty clay-loam, were amended to 1 ppm with mercuric nitrate. Volatilization ceased within one week after amendment; 20% of the mercury was lost from the silty clay-loam, and 43% from the loamy sand. Steam-autoclaved sandy soil amended with mercury indicated that volatilization was the result of microbial action, and that the rate of volatilization was determined by the availability of mercury to the microbes. FATE OF 3,3'-DICHLOROBENZIDINE IN AQUATIC ENVIRONMENTS,
Syracuse Research Corp., NY. Life Sciences Div.
H. C. Sikka, H. T. Appleton, and S. Banerjee.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 526, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency, Report EPA 600/3-78-068, July 1978. 50 p, 21 tab, 5 fig, 42 ref.

Descriptors: Freshwater fish, *Bioassay, Mortality, *Toxicity, Sediments, Public health, Degradation(Decomposition), Sunfish, Freshwater, *Aromatic compounds, Dyes, Pigments, Activated sludge, Aquatic environment, Aquatic microorganisms, *Dichlorbenzidine, Environmental control.

Several aspects of the aquatic environmental fate of 3,3'-dichlorobenzidine (DCB), a suspected human carcinogen, were examined. Greater than 95% of dichlorobenzidine present was adsorbed to natural pond and lake sediments in aqueous suspensions. Only a portion of the adsorbed chemical could be extracted from the sediments, with this amount decreasing over time, suggesting chemical reaction of DCB with sediment constituents. Dichlorobenzidine was rapidly degraded by natural and artificial light in aqueous solution, with a half-life of the order of 90 seconds in natural sunlight. Monochlorobenzidine and a benzidine were found to be intermediate products of this process. In contrast, DCB appeared recalcitrant to degradation by naturally occurring aquatic microbial communities with only a minor loss of chemical detected over a 30-day incubation period. Dichlorobenzidine was rapidly bioconcentrated in bluegill sunfish, with mortality occurring prior to establishment of a chemical equilibrium between water and fish. Bioconcentration factors of 132-554 were achieved at this point. The only metabolite detected in the fish was an acid-labile conjugate of DCB. Based on these observations, chemical and physical processes, rather than biological ones, appear to be the important factors governing the fate of DCB in the aquatic environment. The ability of DCB to concentration in aquatic organisms may pose a direct hazard to human health through consumption of contaminated fish.

FATE AND IMPACT OF PENTACHLOROPHENOL IN A FRESHWATER ECOSYSTEM,
University of Southern Mississippi, Hattiesburg. Inst. of Environmental Science.
R. H. Pierce, Jr.
Environmental Protection Agency, Report EPA 600/3-70-063 July 1978. 62 p, 28 tab, 7 fig, 41 ref.

Descriptors: *Phenol, Toxicity, Fish kills, *Water pollution effects, Environmental effects, Path of pollution, Biodegradation, Persistence, Sunfishes, Freshwater fish, Fish food, Laboratory tests, Ecosystem, Public health, *Pentachlorophenol, *Chlorinated phenols, Food chain bioaccumulation, *Degradation products, Subletha! concentration, Freshwater ecosystems.

This investigation was undertaken to determine the fate of pentachlorophenol (PCP) that caused extensive fish kills in a freshwater lake in December 1974 and again in December 1976. The kills resulted from the accidental release of wood-treating wastes containing PCP in fuel oil. Food chain relationships were investigated in the lake and the accumulation and elimination of sublethal concentrations of dissolved PCP was studied under laboratory conditions for the bluegill (Lepomis macrochirus). The highest concentrations of PCP in fish were observed in the bile followed by liver, gills, and muscle. Lake sediment and leaf litter contained high concentrations of PCP throughout the two-year study. Studies of leaf litter from the contaminated water shed area showed it to be a source for chronic pollution of the aquatic ecosystem. The major degradation products observed were pentachloroanisole (PCP-OCH3) and the 2,3,5,6- and 2,3,4,5-tetrachlorophenol (TCP) isomers. These products were found to persist in sediment and fish along with PCP. The methyl ethers (anisoles) of both TCP isomers and the 2,3,4,6-TCP isomer were observed in some samples but the small amounts were difficult to quantitate. (EIS-Katz)

5C. Effects Of Pollution

ISOLATION OF A MERCURIC CHLORIDE-TOLERANT BACTERIUM AND UPTAKE OF MERCURY BY THE BACTERIUM,
Gifu Univ. (Japan). Dept. of Agricultural Chemistry.
H. Horitsu, M. Takagi, and M. Tomoyeda.
European Journal of Applied Microbiology and Biotechnology, Vol. 5, p. 279-290, 1978. 17 fig, 6 tab, 12 ref.

Descriptors: *Mercury, *Pseudomonas, *Biological membranes, *Tolerance, Bacteria, Electron microscope, Membrane processes, Cytological studies, Cadmium, Chromium, Copper, Heavy metals, Biochemistry, Carbohydrates, Chemical analysis, Proteins, Metabolism, Systematics, *Bacteria, *Mercuric chloride.

A mercuric chloride-tolerant bacterium is isolated from activated sludge and the bacterium was identified as Pseudomonas oleovorans. The bacterium is tolerant up to 350 ppm Hg+, 100 ppm Cd2+, 40 ppm Cr6+, and 1000 ppm Cu2+. Observation by scanning electron microscope of cells growing with mercury shows a less rigid structure of the cell surface than in the case of controls, while observation by transmission electron microscope shows many electron-dense granules in the cytoplasm of cells growing with mercury. By chemical analysis, about 80% of mercury taken up by the cells was found in the cytoplasm, and about 20% in the cell envelope fraction, of the resting cells used. Mercury was found in the supernatant fluid, but not in the microsomal fraction. (EIS-Deal)

EFFECT OF HEXACHLOROBENZENE (HCB) ON THE ACTIVITY OF SOME ENZYMES FROM TETRAHYMENA PYRIFORMIS,
Biologische Bundesanstalt fuer Land und Forstwirtschaft, Berlin (Germany, F.R.). Inst. fuer Nichtparasitare Pflanzenkrankheiten.
F. Geike.
Bulletin of Environmental Contamination and Toxicology, Vol. 20, p. 640-646, 1978. 1 tab, 36 ref.

Descriptors: *Enzymes, *Toxicity, *Protozoa, Metabolism, Cytological studies, Food chains, Chemical analysis, Path of pollutants, Biochemistry, Proteins, Organic compounds, Biological membranes, Insecticides, Chlorinated hydrocarbon pesticides, *Hexachlorobenzene, *Tetrahymena, Benzene hexachloride.

Tetrahymena pyriformis cultures were treated with three different levels of HCB in controlled studies. At a dose level of 0.001 ppm the activity of delta-aminolevulinate dehydratase, hexokinase, and pyruvate kinase remained unaffected but was increased for glutamic-oxaloacetic transaminase, glutamic dehydrogenase, isocitrate dehydrogenase, and malate dehydrogenase while 0.1 ppm HCB increased the activity of all enzymes studied, the only exception being glutamic-pyruvic transaminase, the activity of which was depressed by HCB exposure. A concentration of 1.0 ppm HCB depressed the activity of most of the enzymes below control values with the exception of the two mitochondrial enzymes, MDH and ICDH, studied here. (EIS-Deal)

THE EFFECT OF ENDRIN ON THE HISTOPATHOLOGICAL CHANGES IN THE LIVER OF CHANNA PUNCTATUS,
D.A.V. Coll. Muzaffaragar (India). Dept. of Zoology.
K. V. Sastry, and S. K. Sharma.
Bulletin of Environmental Contamination and Toxicology, Vol. 20, p 674-677, 1978. 3 fig, 19 ref.

Descriptors: *Endrin, *Chlorinated hydrocarbon pesticides, *Pesticide toxicity, Cytological studies, Fish physiology, Fish diseases, Animal pathology, Toxicity, Path of pollutants, Water pollution effects, Pesticide kinetics, Chemical analysis, Tissue analysis, Liver, *Histology, *Channa.

Treatment with endrin produced acute pathological changes in the liver of Channa punctatus. Eight hours after injection the liver was characterized by hypertrophy of hepatocytes. The toxic changes were more severe in the centrolobular area than in the perilobular area. By 24 hours there was marked hypertrophy of the hepatic cells. Cell necrosis was severe, with the cell membranes in most cells ruptured. The histopathological changes observed here are not characteristic of endrin alone. A number of organochlorine compounds are known to produce similar toxic effects. (EIS-Deal)
W79-03503

EFFECTS OF SOME TRACE ELEMENTS ON THE BLOOD OF KUWAIT MULLETS LIZA MACROLEPIS (SMITH),
Kuwait Inst. for Scientific Research.
M. M. Helmy, A. E. Lemke, P. G. Jacob, and B. L. Oostdam.
Journal of Experimental Marine Biology and Ecology, Vol 34, p 151-161, 1978. 2 tab, 62 ref.

Descriptors: *Lead, *Mercury, *Copper, *Toxicity, *Mullets, Heavy metals, Trace elements, Bioassay, Animal pathology, Fish physiology, Chemical analysis, Bioindicators, Fish diseases, Cytological studies, Biochemistry, Tissue analysis, *Liza, *Histology, Hematology.

Haemopathological changes attributed to heavy metal poisoning were observed in blood smears of Liza macrolepis taken after exposure of 96 h to graded doses of copper, lead, and mercury in a flow-through marine bioassay system. In general, changes in leucocytic profile appear to be correlated with pathological changes caused by increasing copper and mercury concentrations. By contrast, blood samples of mullets exposed to lead, showed significant polychromasia and + 1 anisocytosis regardless of concentrations. The RBC count, haemoglobin content, and haemoglobin content, and haematocrit percentages were less valuable in dianosis of copper and mercury effects. These manifestations of poisoning by trace elements bear a resemblance to the pathological changes that have been shown clinically and experimentally in mammals. Consequently, blood measurements on marine organisms may be diagnostic of undesirably high levels of copper and mercury, and so may constitute useful indicators of marine pollution. (EIS-Deal)

ULTRASTRUCTURAL ALTERATIONS IN THE EGGSHELL GLAND EPITHELIUM OF THE MALLARD DUCK AFTER CHRONIC EXPOSURE TO DDT,
Edgewood Arsenal, Aberdeen Proving Ground, MD. Biomedical Lab.
G J Kolaja, and D E Hinton
Environmental Pollution, Vol. 17, p. 237-244, 1978. 5 fig, 17 ref.

Descriptors: *DDT, *Reproduction, *Bird eggs, *Mallard duck, Electron microscopy, Cytological studies, Calcium, Pesticide toxicity, Chlorinated hydrocarbon pesticides, Animal physiology, Animal pathology, Animal metabolism, Biochemistry, Biological membranes, Enzymes, Path of pollutants, Water pollution effects, *Histology

The effects of chronic ingestion of DDT were studied on the ultrastructure of the eggshell gland of the mallard duck. Ultrastructural changes seen were oedema of the Type II epithelium cells, as demonstrated by decreased electron density, and vacuoles in the endoplasmic reticulum. Since the Type II cells are responsible for the transport of calcium, alterations in these cells indicate that decreased calcium transport may be responsible for DDT-induced eggshell thinning. (EIS-Deal)

UREA FERTILIZATION OF NATURAL FOREST: EFFECTS ON WATER QUALITY,
Laurentian Forest Research Centre, Quebec (Ontario).
A. Gonzalez, and A. P. Plamondon.
Forest Ecology and Management, Vol 1, No 3, November 1977, p 213-221. 1 fig, 22 ref

Descriptors: *Ureas, *Fertilization, *Forest watersheds, *Water pollution effects, *Water pollution sources, *Streams, Nutrients, Nitrogen, Montmorency Experimental Forest(Quebec-Canada), Canada, Lumbering, Fertilizers, Ammonium, Conductivity, Nitrates, Rainfall, Balsam fir trees, White spruce trees, Birch trees

Fertilization with urea at a rate of 150 kg N/ha of a 120-ha forest watershed in Laval University's Montmorency Experimental Forest 80 km north of Quebec, Canada in June and September 1973 had no significant effect on water quality. A contiguous 120-ha watershed served as control. Only ammonium and conductivity increased significantly in stream water in the 10-15 days following application; nitrate increased slightly for a short time, and other parameters exhibited small changes. Urea was identified only at trace levels during the 48 hrs after fertilization, and only ammonium was temporarily above international drinking water guidelines. Storm intensity strongly influenced water quality response to fertilization; abundant rainfall coincided with the application. The watersheds were covered with a natural stand of 80% balsam fir, 10% white spruce, and 10% white birch. Altitude is 783-994 m, trees average 30 years old, mean terrain slope is 20%, and average precipitation is 140 cm. This type of forest represents 25% of the logging potential of Quebec Province. Samples were collected manually in a turbulent section in the lower part of the main drainage stream in each watershed. Parameters determined were DO, pH, conductivity, turbidity, color, nitrogen, organic carbon, metal cations, and filterable residues. Several factors reduce the effects of forest fertilization on water quality, compared with agricultural fertilization. (Lynch-Wisconsin)

THE DECLINE OF LAKE PLANTS,
R. L. Stuckey.
Natural History, Vol 87, No 7, August-September 1978, p 66-69.

Descriptors: *Lakes, *Aquatic plants, *Put-in-Bay(OH), *Lake Erie, *Water pollution effects, *Limiting factors, Macrophytes, Submerged plants, Floating plants, Turbidity, Water level fluctuations, Great Lakes, Ohio, Soil erosion, Dredging, Recreation, Succession, Dissolved oxygen, Water temperature, Islands, South Bass Island(OH), Harbors, Bays, Vallisneria americana.

Aquatic macrophytes in Put-in-Bay harbor on the north shore of Ohio's South Bass Island in western Lake Erie have declined from 40 species in 1898 to 20 in 1967-70 because of: (1) water level fluctuations; (2) increased water temperature; (3) increased turbidity from erosion, dredging, and shoreline construction; (4) decreased dissolved oxygen; and (5) increased recreation. Surveys of submersed, floating, and emersed plants were made in 1898 (Pieters), 1934 (Tiffany), 1949 (Core), and 1967-70 (the present study). Of Pieter's 40 species, eight had disappeared by 1934, and 14 by 1949. Of the 20 remaining in 1967-70, only one (Vallisneria americana) was abundant, two were common, eight were occasional, and nine were rare. There have been few changes since 1967. Rush-like plants which lined the shore of Squaw Harbor (a section of Put-in-Bay) in 1898 were almost eliminated by 1949 due to construction of boat docks, and small colonies of seven emersed species observed along the shoreline in 1967 had disappeared by 1970 following a sudden rise in lake water level and increased boat traffic. The 13 species of submersed plants recorded for Squaw Harbor in 1949 were reduced to seven by 1967-70. By 1949 few plants were found at all in the main harbor, true also in the late 1960s. Of the 20 species no longer present in Put-in-Bay harbor, 11 occur principally in cool-water habitats primarily north of Lake Erie, while 14 of the 20 surviving species from Pieter's survey have widespread distributions. (Lynch-Wisconsin)

ON THE RELATION OF ORGANOTROPHY OF MARINE UNICELLULAR ALGAE TO THE DENSITY OF THEIR EXPERIMENTAL POPULATIONS AND INDIVIDUAL WEIGHTS OF CELLS,
Institute of Biology of the Southern Seas, Sevastopol (USSR)
K. M. Khailov, Z. P. Burlakova, L. A. Lanskaya, and N. A. Lavrentyev
Marine Science Communications, Vol 4, No 2, 1978, p 153-173. 9 fig, 2 tab, 30 ref.

Descriptors: *Organotrophy, *Marine algae, *Cell weight, *Cell density, *Organic compounds, Unicellular algae, Algae, Weight, Biomass, Plant populations, Population dynamics, Density, Cultures, Gymnodinium kovalevskii, Gymnodinium lanskaya, Prorocentrum micans, Gyrodinium fissum, Peridinium trochoideum, Glenodinium foliaceum, Thalassiosira, Stephanopixis palmeriana, Chaetoceros affinis, Dinoflagellates, Diatoms, Glucose, Gylcolic acid, Plant physiology, Pyrrophyta, Chrysophyta.

Dependence in unicellular marine algae of the specific velocity of cell accumulation of dissolved organic substances (glucose and glycolic acid) on population density and individual cell weight was investigated with axenic cultures of nine dinoflagellates and diatom species. Density and weight together are inversely related to specific velocity. Moreover, the dependence of velocity on density may be approximated by exponential equations (given in a table) where the upper index approaches 1.0, the relationship between velocity and weight is similar, but equation parameters has not been defined. Most studies of algae (especially regarding organotrophy) have disregarded the influence of cell concentration in seawater, which

varies by as much as 10-10,000,000 cells/l. Data reported here show that cell densities greatly affect specific rates of organic solute consumption, and therefore data on such consumption cannot be satisfactorily interpreted without specifying population density. Species investigated were Gymnodinium kovalevskii, G. lanskaya, Prorocentrum micans, Gyrodinium fissum, Peridinium trochoideum, Glenodinium foliaceum, Thalassiosira sp., Stephanopixis palmeriana, and Chaetoceros affinis. Cultures in the logarithmic growth stage were used in the experiments, carried out in 100-ml bottles with algal densities of about 1,000-1,000,000 cells/l. Carbon-14-labelled glucose or glycolic acid were added at 0.2 mg/l. (Lynch-Wisconsin)

THE BLUE-GREEN ALGAE KEEP COMING,
E. F. Stoermer.
Natural History, Vol 87, No 7, August-September 1978, p 59-61.

Descriptors: *Eutrophication, *Great Lakes, *Phytoplankton, *Water pollution effects, *Phosphorus, Trophic level, Oligotrophy, Lakes, Algae, *Cyanophyta, Chlorophyta, Diatoms, Nutrients, Ecosystems, Succession, Limiting factors, Silicon, Nitrogen, Transparency, Lake Erie, Lake Superior, Zooplankton, Fish, Chrysophyta.

Increasing eutrophication of the Great Lakes is described, and mechanisms responsible for the change from diatom to cyanophyte dominance of phytoplankton are explained. Lakes Erie and Ontario are the most seriously affected, Lake Superior the least. Physical characteristics which have affected algal populations include: (1) small drainage relative to surface area and leaching-resistant bedrock resulted in nutrient-poor waters (except for nitrogen) in the pristine lakes; (2) tremendous heat-storing capacity as a result of their great mass restricts nutrient dispersal because of the thermal bar between enriched nearshore waters and the deep water; (3) only 10,000 years old, the lakes have less-well-adapted and less-resilient biota; and (4) their location on the boundary between the northern boreal forest zone and the humid temperature region, and their east-west orientation and mineral deposits encouraged migration of settlers to the Midwest. In pristine offshore waters, diatom dominated the phytoplankton, favored by low nutrient levels, relatively cold water, and limited light in deep water. With settlement of lake shores, phosphorus loading increased, reaching into the middle of the lakes and stimulating algal growth and algal uptake of other nutrients. Silicon, needed by diatoms, was depleted and blue-green and green algae not needing silicon became dominant. Diminished nitrogen levels eventually favored cyanophytes, along able to use atmospheric nitrogen. (Lynch-Wisconsin)

AN EXPERIMENTAL SIMULATION OF CHANGES IN DIATOM AND FLAGELLATE BLOOMS,
British Columbia Univ., Vancouver. Inst. of Oceanography.
T. R. Parsons, P. J. Harrison, and R. Waters.
Journal of Experimental Marine Biology and Ecology, Vol 32, No 3, May 1978, p 285-294. 4 fig, 22 ref.

Descriptors: *Diatoms, *Flagellates, *Phytoplankton, *Eutrophication, *Light intensity, *Nitrates, Limiting factors, *Succession, *CEPEX Program, *Controlled experimental ecosyste, Nutrients, Phosphorus, Chlorophyta, Dinoflagellates, Food chains, British Columbia(Canada), Canada, Oceans, Pacific Ocean, Gonyaulax catenella, Simulation analysis.

An enclosed plastic cylinder (Controlled Experimental Ecosystem, or CEE) 23 m deep and 9.5 m diameter containing about 1300 cu m of seawater was floated in the coastal Pacific Ocean at Vancouver, British Columbia, Canada, (Cepex Project) to simulated phytoplankton succession from a diatom to a flagellate bloom through control of light and nutrients. Surface waters were kept mixed, and temperature increased from 11 C to more than 15 C during the 60-day experiment. Upwelling was varied by means of pumping from 22 m, and nutrients were added as KH2PO4, KNO3, and Na2SiO3-9H2O to raise nitrates from zero after day 5 to 0.5 microgram-at. NO3-N/l from day 5 to 30, and to over three micrograms/l by day 35. On day 38 a light shield was installed over the CEE to reduce average radiation in the top four m to 20% of the former level. Three blooms occurred: (1) a diatom bloom at the start (chlorophyll-a maximum of 10 mg/cu m); (2) a flagellate bloom after 32 days (chl-a maximum 3 mg/cu m); and (3) a diatom and flagellate bloom after 60 days (5 mg/cu m). There may exist in the ocean a diatom corridor of maximum growth leading to blooms, surrounded by a flagellate-dominated area, with both small and large cells. Diatom dominance occurs in high-nitrate environments (except when silicate is lacking). Flagellates dominate in low-light regimes, diatoms at higher light, and 'high-light' flagellates at still higher intensities. (Lynch-Wisconsin)

STIRRING INFLUENCES THE PHYTOPLANKTON SPECIES COMPOSITION WITHIN ENCLOSED COLUMNS OF COASTAL SEA WATER,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
R. W. Eppley, P. Koeller, and G. T. Wallace, Jr.
Journal of Experimental Marine Biology and Ecology, Vol 32, No 3, May 1978, p 219-239. 8 fig, 4 tab, 30 ref. NSF IS074-04838.

Descriptors: *Phytoplankton, *Diatoms, *Cell size, *Species composition, *Zooplankton, *Mixing, *CEPEX Program, *Controlled experimental ecosystem, Stirring, Coscinodiscus, Noctiluca, Pleurobrachia, Copepods, Ctenophora, Succession, Food webs, Coasts, Nutrients, Grazing, Predation, Copper, Settling velocity, Species diversity, Saanich Inlet(BC-Canada), Canada.

Stirring of seawater in two polyethylene cylinders 16.1 m deep by 2.4 m diameter (Controlled Experimental Ecosystems, or CEEs) at Saanich Inlet, Vancouver Island, British Columbia, Canada (CEPEX Project) maintained dominance of large-celled diatoms (Coscinodiscus spp), while in two unstirred CEEs microflagellates became dominant after 2-4 wks. Turbulent mixing of the quiescent water is needed to maintain in suspension large-celled phytoplankton with rapid sinking rates. In one CEE stirred to 15 m, large-celled species remained dominant over the entire experiment (31 August-14 October 1976), while in a CEE stirred only to 10 m phytoplankton cell diameter ultimately declined, apparently as a result of grazing pressure by herbivorous copepods (Noctiluca sp). It is thought that in the deep-stirred CEE such grazing was prevented by predation on the copepods by the ctenophore Pleurobrachia sp; a higher phytoplankton standing stock also resulted. Stirring to the bottom may develop equilibrium among components of the simple linear food web. Stirring resulted in net nutrient utilization ratios typical of the open sea, while in unstirred CEEs the N:P utilization ratio was high. Addition of 15 micrograms/l copper reduced copepod feeding rate but did not cause mass mortality. (Lynch-Wisconsin)

Chemistry and Industry, July 16, 1977, p 612-616, 20 ref.

Descriptors: *Water pollution effects, *Cooling water, *Sea water, *Intakes structures, Screens, Corrosion, Mortality, Fish, Invertebrates, Plankton, Heated water, Discharge(Water), Sites, Design.

Biological problems associated with the use of seawater for cooling are identified as being direct problems and environmental considerations. Direct problems are mainly intake-screen blockage, condenser-tube fouling and biologically induced corrosion. Environmental considerations include intake mortalities of fish and invertebrates, plankton mortalities incurred in transit through the cooling system, and possible effects of discharged heat, biocides, corrosion products or other chemicals on life in the receiving waters. Discussion of the problems and progress made in the past few years leads to the conclusion that by careful biological investigation early in the pre-siting and pre-design stages, many of the potential problems can be identified and steps taken to minimize their occurrence and effects. HISTOPATHOLOGICAL EFFECTS INDUCED IN MYTILUS EDULIS BY MYTILICOLA INTESTINALIS AND THE HISTOCHEMISTRY OF THE COPEPOD INTESTINAL CELLS,
Institute for Marine Environmental Research, Plymouth (England).
M. N. Moore, D. M. Lowe, and J. M. Gee
International Council for the Exploration of the Sea, Journal Du Conseil, Vol 38, No 1, 1978, p 6-11, 2 fig, 21 ref

Descriptors: Environmental effects, Parasitism, Temperature, *Mussels, *Pathology, Animal parasites, Histopathology, Cytological studies.

Epithelial cells lining the intestine and rectum of infected mussels exhibited metaplasia, the normal ciliated columnar cells being replaced by a non-ciliated cuboidal cell type. No significant differences were observed in numbers of macrophages in connective tissues of uninfected or infected mussels maintained at 10C after 12 or 81 days but both uninfected and infected animals maintained at 22C for 12 days showed significant increases in macrophages in connective tissues. After 81 days, no significant difference could be detected in numbers of macrophages between the four groups of mussels, indicating that the animals at the higher temperature had attained a steady state after the initial response. It was concluded that the parasite had no significant effect on the basic cellular functions of the mussel. (Chilton-ORNL)

PHYSIOLOGICAL RESPONSES OF MYTILUS EDULIS L. TO PARASITIC INFESTATION BY MYTILICOLA INTESTINALIS,
Institute for Marine Environmental Research, Plymouth (England)
B. L. Bayne, J. M. Gee, J. T. Davey, and C. Scullard
International Council for the Exploration of the Sea, Journal Du Conseil, Vol 38, No 1, 1978, p 12-17, 5 fig, 2 tab, 19 ref

Descriptors: Environmental effects, *Parasitism, Temperature, *Mussels, Metabolism, Growth rates, Respiration, Feeding rates, Animal parasites, Thermal stress

Physiological measurements were made on Mytilicola intestinalis infested mussels maintained at 10, 22, and 23C. Rates of oxygen consumption were significantly higher at 22 than at 10C with a mean temperature coefficient over all conditions of time and infestation level of 1.29 ... or 0.12. There was no significant overall effect of temperature on fil

tration rate. Rates of ammonia excretion were higher at 22 than at 10C did not acclimate over time. Only filtration rates were significantly affected by infestation level with filtration rate being depressed at increasing infestation levels. (Chilton-ORNL)

A BIOENERGETIC MODEL FOR THE ANALYSIS OF FEEDING AND SURVIVAL POTENTIAL OF WINTER FLOUNDER, PSEUDOPLEURONECTES AMERICANUS, LARVAE DURING THE PERIOD FROM HATCHING TO METAMORPHOSIS,
National Marine Fisheries Service, Narragansett, RI. Narragansett Lab.
G. C. Laurence
Fishery Bulletin, Vol. 75, No. 3, July 1977, p 529-546, 17 fig, 3 tab, 63 ref

Descriptors: Environmental effects, *Model studies, *Fish, *Larvae, *Larval growth stage, Growth rates, Feeding rates, Temperature, Metabolism, Food abundance, Prey, Mortality

The model examined in this study includes the forcing variables of temperature, prey density, and larval size or age and their effects on the ability of winter flounder larvae to successfully acquire energy rations necessary for experimentally determined growth and metabolic parameters. Prey density was found to be one of the most important factors affecting survival during the larval stage. Specific growth rates ranged from 5.72 to 8.70%/day at survival prey concentrations of 3.7 to 21.7 cal/liter. Critical prey densities below which larvae did not have sufficient time during the day to obtain adequate food for growth and metabolism varied with age and ranged from 2.1 to 5.7 cal/liter. These studies were conducted at a constant temperature of 8C. (Chilton-ORNL)

THERMAL SELECTION OF BULLFROG TADPOLES (RANA CATESBEIANA) AT DIFFERENT STAGES OF DEVELOPMENT AND ACCLIMATION TEMPERATURES,
Oklahoma Univ., Norman. Dept. of Zoology.
V. H. Hutchison, and J. G. Hill
Journal of Thermal Biology, Vol. 3, p 57-60, 1 fig, 1 tab, 20 ref, 1978

Descriptors: Environmental effects, *Thermal pollution, Temperature, Amphibians, *Frogs, Growth stages, Animal behavior, Preferred temperature, Acclimation temperature, Thermal selection, Thermoregulation

Preferred temperatures (PT) of bullfrog tadpoles were determined at developmental stages 25-26, 35-36, 39-40, 41, and 43-44 and at acclimation temperatures (AT) of 4.4, 15.5, 26.7, and 35C. At stage 25-26, high AT resulted in lower PT than was found in tadpoles acclimated at intermediate AT. Increased AT at stages 43-44 resulted in increased PT at all stages. PT distributions was bimodal at some combinations of stage and AT. Some combinations of early stage and low AT resulted in strongly truncated distributions of PT at the cold end of the gradient. The overall mean PT for all groups was 20.66C and the overall mode, 20.97C. The greatest variation among the different AT groups occurred in animals acclimated to 35C. Among the different developmental stages, the greatest variation was in stages 43-44. It was suggested that the plasticity of PT with changes in AT is one of the strategies which ectotherms employ to circumvent the deleterious consequences of rapid changes or thermokinetic extremes. THERMAL SENSITIVITIES OF MALATE DEHYDROGENASE ISOZYMES IN TYPHA,
South Carolina Univ., Columbia. Dept. of Biology.
E. H. Hu, R. R. Shantz, and M. H. Smith
American Journal of Botany, Vol. 65, No. 2, 1978, p 214-220, 4 fig, 3 tab, 22 ref. ERDA EY-76-C-09-0819

Descriptors: Environmental effects, *Water pollution effects, *Thermal pollution, Aquatic plants, Enzymes, Temperature, Thermal stress, *Cattails

Of the cattails from the test area (an impoundment subjected to thermal stress from Savannah River Plant, South Carolina), Typha domingensis was found to be intolerant of the thermal stress in the hottest section of the pond and its entire complement of malate dehydrogenase (MDH), isozymes were denatured by heating at 50C. Typha latifolia was found to be tolerant to the thermal stresses in the hottest section and three of its MDH isozymes were unaffected by heating at 50C. It was suggested that natural selection might have led to these differences in thermal stability of the MDH isozymes. Both species are electrophoretically monomorphic and no variation in isozyme expression in ten enzyme systems was found in the test populations. (Chilton-ORNL)

TEMPERATURE ACCLIMATION AND OTHER INFLUENCES ON EMBRYONIC DURATION IN THE COPEPOD PSEUDOCALANUS SP.,
Dalhousie Univ., Halifax (Nova Scotia). Dept. of Biology.
R. C. Hart, and I. A. McLaren
Marine Biology, Vol. 45, No. 1, 1978, p 23-30, 4 fig, 2 tab, 17 ref

Descriptors: Environmental effects, *Temperature, *Copepods, Growth stages, *Embryos, *Growth rates, Size

Eggs of Pseudocalanus females captured at the end of winter developed more slowly than did those taken in summer and early autumn. Mean development times were clearly related to cephalothorax lengths of females. Investigations showed size-assortative mating and that the size of the male also influenced embryonic duration. After short-term acclimaton, embryos developed relatively more rapidly at low temperatures indicating a clockwise rotation of the rate-temperature response. Since larger females from a given season produce embroys showing this rotation of rate-temperature response, it was suggested that seasonal rotation may also be related to seasonal variatons in size. It was concluded that short-term temperature acclimation affects embryonic duration in Pseudocalanus slightly, and in the expected compensatory way, but that there is need for further investigation into some of the other relationships observed in this study. VARIATIONS IN THE SHALLOW WATER FORM OF POTAMOGETON RICHARDSONII INDUCED BY SOME ENVIRONMENTAL FACTORS,
Guelph Univ., (Ontario). Dept. of Botany and Genetics
D. H. N. Spence, and H. M. Dale
Freshwater Biology, Vol. 8, 1978, p 251-268, 9 fig, 9 tab

Descriptors: *Environmental effects, *Temperatures, *Light, Aquatic plants, Shallow water, *Plant morphology, *Radiation.

This paper assesses the differential effects of ontogeny, photosynthetically active radiation (PAR), and temperature on shoot growth of P. richardsonii along with overall effects of light and nutrients on biomass, and of shelter on leaf area index. The data suggest that light, temperature and ontogeny interact on vertical shoot extension so that maximal extension occurs on young shoots in very low irradiance at temperatures above 9C. Effects of increasing water temperature are depressed by increasing irradiances and ageing until minimal extension takes place in old shoots at mid- to late-summer temperature in high irradiances. Leaf length/breadth ratio was increased by low irradiance, significantly at 4% daylight, and by ontogenetic drift at high irradiances of shallow water. Length/breadth ratio was not correlated with substrate. (Chilton-ORNL)

SURVIVAL AND VIABILITY OF ESCHERICHIA COLI IN A THERMALLY ALTERED RESERVOIR,
Savannah River Lab., Aiken, SC
R. W. Gorden, and C. B. Fliermans.
Water Research, Vol. 12, No. 5, 1978, pp 343-352, 5 fig, 4 tab, 29 ref.

Descriptors: *Environmental effects, *Thermal pollution, *Bacteria, Mortality, Resistance, Growth rates, Nuclear reactors, Reservoirs, Thermal water, Bioindications, *E. coli.

The objectives of this study were to determine the ability of E. coli populations to survive and grow in a warm, monomictic reservoir receiving thermal effluent from a nuclear production reactor and to contribute to the evaluation of E. coli as an indicator of fecal contamination. Known populations of the bacteria were suspended in sterile chambers at various depths. Under temperature conditions of the reactor not operating (RNO) and reactor operating (RO), the E. coli survived and grew at each depth and at all stations. Under RO conditions, the populations reached higher optical densities and maintained those densities for longer time periods than under RNO conditions. Differences between population survival and growth during thermal alterations suggest that care must be taken when E. coli is regarded as an indicator of recent fecal contamination in warm aquatic ecosystems. UPPER TEMPERATURE TOLERANCES OF TELLINA TENUIS AND T. FABULA,
Glasgow Univ. (Scotland). Dept. of Zoology.
J. G. Wilson
Marine Biology, Vol. 45, No. 2, 1978, p 123-128, 2 fig, 4 tab, 30 ref.

Descriptors: *Environmental effects, *Temperature, *Mollusks, Resistance, Mortality, Distribution patterns, Littoral, Shallow water, Interitidal areas

Short- and long-term mortalities of molluscs (T. tenuis and T. fabula) were investigated in animals exposed to a variety of temperature regimes. Short-term tolerance tests showed the LD50 to be 31.50C for T. tenuis and 26.5C for T. fabula. Long-term tests also showed T. tenuis to be more tolerant at both high high and low extremes of temperature with a consistent difference in tolerance of about 5C. Both species adapted to higher temperatures after steady temperature acclimation but not to gradually increasing temperature. Even though T. tenuis showed greater thermal tolerance, both species have the same geographical range. The thermal tolerance is reflected in their respective littoral and sublittoral distributions with T. tenuis being found on the shore and T. fabula being confined to below low water. (Chilton-ORNL)

CARBONIC ANHYDRASE (ACETAZOLAMIDE-SENSITIVE ESTERASE) ACTIVITY IN THE BLOOD, GILL AND KIDNEY OF THERMALLY ACCLIMATED RAINBOW TROUT, SALMO GAIRDNERI.
Brock Univ., St. Catharines (Ontario). Dept. of Biological Sciences.
A. H. Houston, and L. S. McCarty
Journal of Experimental Biology, Vol. 73, 1978, p 15-27, 1 fig, 2 tab, 50 ref.

Descriptors: Environmental effects, *Thermal pollution, Temperature, Trout, *Rainbow trout, Fish, Animal physiology, Enzymes, Compensation

At acclimation temperatures of 2, 10, and 18 carbonic anhydrase activity as well as plas

levels of sodium, potassium and chloride were investigated in rainbow trout. Sodium and chloride concentrations and the sodium: chloride ratio did not vary significantly. Potassium levels were significantly higher at 18C. Acclimation to higher temperatures resulted in elevation of blood carbonic anhydrase activity. Under physiologically realistic incubation temperature conditions, changes were observed in renal and branchial carbonic anhydrase cativity which were modest but significant. It was concluded that branchial and renal carbonic anhydrase activities may provide relatively thermostable basal rates of sodium and chloride uptake. Augmentation of recruitment at temperatures which promote increased electrolyte depletion appears to be largely associated with increased branchial (Na+/K+) ATPase and erythrocyte carbonic anhydrase activities. RETARDATION OF SEDIMENT PHOSPHORUS RELEASE BY FLY ASH APPLICATION,
Notre Dame Univ., IN.
T. L. Theis, and P. J. McCabe.
Journal Water Pollution Control Federation, Vol. 50, No. 12, December 1978, p. 2666-2676, 8 fig, 4 tab, 21 ref. EPA R801245.

Descriptors: Environmental effects, *Water pollution effects, Sediments, *Phosphorus, Fly ash, Lakes, Eutrophication.

This study reports on the effects of the placement of a layer of fly ash on the sediments of a small, culturally eutrophic lake. The application brought about a reduced release of phosphorus during anoxic periods due to both physical and chemical alterations in the sediments. A sharp decrease in sediment moisture content was noted in comparison to control sediments. CDB (citrate-dithionite-bicarbonate extractable) iron and phosphorus values were reduced by an average of 37 and 44% respectively. Previous criteria for selection of fly ash for application to lake sediments have been identified as lime content and comparative specific gravity relative to the sediments to be treated. It is suggested that the CDB iron and phosphorus contents and potential for heavy metal release to the sediment environment be added to the criteria. (Chilton-ORNL)

ASPECTS OF ESTUARINE INTERTIDAL ECOLOGY OF JUVENILE STRIPED MULLET, MUGIL CEPHALUS, IN HAWAII,
California Univ., Santa Cruz. Center for Coastal Marine Studies.
P. F. Major.
Fishery Bulletin, Vol. 76, No. 2, 1978, p. 299-314, 3 fig, 3 tab, ref.

Descriptors: *Environmental effects, *Temperature, Salinity, Fish, Distribution patterns, *Mullet, Estuaries, *Estuarine environment, Intertidal areas, Predation, Schools(Fish), *Hawaii.

An experimental vertical thermal gradient was used to study the relationship between salinity and temperature and the distribution of schools of young striped mullet. Field observations were made of the distribution, feeding, and predator-prey behavior of schooled mullet. Depth and temperature distribution results taken together indicated that temperature selection was the more important factor in distribution. Fish < or = 50 mm standard length (SL) showed a predilection towards the surface whereas fish > or = 50 mm SL appeared predisposed towards the bottom before the initiation of heating or cooling. In the field, fish > or = 50 mm remained seaward of the tide of heating or cooling. In the field, fish > or = 50 mm remained seaward of the tide line in water of lower and more uniform temperature and higher and more uniform salinity than those recorded for mullet < 50 mm. The formation of large schools during all stages of life appears to be important in reducing predation and possibly also in competing with other species for food and space in estuarine intertidal region. CHANGES IN MUSCLE PHOSPHOFRUCTOKINASE IN TEMPERATURE ACCLIMATED WINTER FLOUNDER (PSEUDOPLEURONECTUS AMERICANUS),
Memorial Univ. of Newfoundland, St. John's. Dept. of Biochemistry.
L. L. Longerich, and L. A. W. Feltham.
Journal of Thermal Biology, Vol. 3, 1978, p. 61-67, 7 fig, 2 tab, 33 ref.

Descriptors: Environmental effects, *Water pollution effects, Thermal pollution, *Flounder, *Temperature, Fish, Enzymes.

Flounder white muscle tissue was assayed to determine if temperature compensation could be demonstrated in these fish through a change in the activity of the allosteric enzyme phosphofructokinase (PFK) and whether this compensation was due to quantitative or qualitative changes in the enzyme. Flounder muscle PFK specific activity increased with increasing amounts of fructose-6-phosphate(F-6-P). Affinity for F-6-P was the same for fish acclimated to both OC and 15C as shown by similar S50 values. There was no evidence that PFK from the two sets of acclimated fish behave differently to any of the effectors test, however, the specific activity of muscle homogenate PFK from OC acclimated flounder was significantly higher than that of the 15C acclimated flounder. The evidence suggested that this difference is due to a quantitative change in the amount of enzyme produced in the winter flounder under different environmental temperatures. (Chilton-ORNL)

WORKSHOP ON COPPER IN ESTUARINE, CONTINENTAL AND MARINE WATERS.
Department of Energy, Washington, DC. Div of Biomedical and Environmental Research.
Available from the National Technical Information Service, Springfield, VA 22161 as CONF-771236, Price codes: A03 in paper copy, A01 in microfiche. CONF-771236, UC-11, April 1978. Summary of a Workshop held in San Francisco, California, December 7-8, 1977, Templeton, W.L. (Ed.) 36 p.

Descriptors: *Conferences, Publication, Technical societies, *Copper, *Estuarine environment, Ecosystems, Freshwater, Sea water.

This report is the summary of a workshop held in conjunction with the Fall Meeting of the American Geophysical Union as an adjunct to the AGU sessions on Copper in Estuarine, Continental and Marine Waters. The intention of the workshop was to provide a basis for discussion and interaction by scientists. Short summaries of the four major topic areas (Analytical and Sampling Techniques, Copper/Ecosystems Interactions, Biological Availability, and Biological Uptake and Effects) which were prepared by the discussion leaders are printed in this report. Abstracts of papers presented at AGU session on Copper in Estuarine, Continental and Marine Waters are included in the report. (Chilton-ORNL)

PHOSPHATE INCORPORATION BY DAPHNIDS AND CHANNEL CATFISH IN PHOSPHATE-RICH ENVIRONMENTS,
Syracuse Research Corp., NY. Center for Chemical Hazard Assessment.
J. R. Strange, W. E. Kerr, P. M. Allred, and D. J. Fletcher.
Journal of Environmental Science and Health, Vol. 12, No. 7, p 311-325, 1977. 1 fig, 3 tab, 6 ref. OWRT B-088-GA (3).

Descriptors: *Water pollution effects, *Phosphates, *Food chains, *Catfishes, *Daphnia, Radioactive wastes, Laboratory tests, Plankton, Chemical analysis, Path of pollutants, Food webs, Ecosystems, Water pollution, Phosphorus compounds.

Studies undertaken to determine the extent to which Daphnia incorporated phosphate and the extent of the bioconcentration and bioaccumulation of phosphate in channel catfish are reported. Three different laboratory experiments were conducted for the studies: (1) Daphnia were examined for phosphorus uptake after radiolabelled and unlabelled phosphate were introduced into the water; (2) catfish uptake was examined after the injection of radiolabelled and unlabelled phosphate into the water; (3)catfish were fed Daphnia which had incorporated phosphate, and then examined for bioaccumulation of phosphorus. The Daphnids maintained a steady level of radioactive phosphate after the slight decline in measured radioactivity. The catfish directly exposed to the radiolabelled phosphate for two weeks incorporated labelled phosphate in detectable amounts in all tissues examined. Bioconcentration was found in the heart, brain, liver, and bone; while gill, stomach, and kidney activities remained constant. Bioaccumulation studies of the phosphate incorporated Daphnis fed catfish showed bioaccumulation in the bone, gill, brain and kidney. It is concluded that Daphnia and channel catfish directly incorporate inorganic phosphate in environments with a high phosphate content. (Davison-IPA)

THE EFFECT OF WASTEWATER TREATMENT ON METHANOGENESIS IN A MARINE OUTFALL,
California Univ., Los Angeles.
A. L. Warford, and D. R. Kosiur.
Journal of the Water Pollution Control Federation, Vol. 51, p 37-42, 1979. 3 fig, 2 tab, 22 ref.

Descriptors: *Methane, *Methane bacteria, *Sewage treatment, Outlets, *Outfall sewers, Waste water treatment, Sulfates, Sulfides, Organic matter, Water analysis, Chemical analysis, Sediments, Bacteria, Carbon cycle, *Methanogenesis.

Methanogenesis in the Avalon outfall sediments of Santa Catalina Island, California, was monitored in its natural environment before and after the initiation of wastewater treatment. After treatment began, the outfall sediments were less reducing and contained less organic matter, which led to a thirty fold reduction in the rate of methane production. High concentrations of sulfide and the presence of active sulfate-reduction did not inhibit methanogenesis, contrary to the observations in lacustrine sediments. Methanogenesis was observed to recycle annually 0.13% of the organic carbon. (EIS-Deal)

MORTALITY PATTERNS IN TROUT (SALMO TRUTTA AND S. GAIRDNERI) EXPOSED TO AN ANIONIC DETERGENT IN RELATION TO CONCENTRATION AND MECHANISMS OF TOXIC ACTION,
Sunderland Polytechnic (England). Dept. of Biology
P. D. Abel.
Freshwater Biology, Vol. 8, p 497-503, 1978. 4 fig, 2 tab, 10 ref

Descriptors: *Mortality, *Detergents, *Rainbow trout, *Brown trout, Toxicity, Bioassay, Path of pollutants, Organic compounds, Sulfates, Chemical analysis, Statistical methods, Fish physiology, Animal metabolism, Electron, Microscopy, Cytological studies, *Sodium lauryl sulphate, Anionic detergent, *Tissue analysis, *Histology, *Probit lines, Mortality patterns

Histological and electron microscopical study of the gills of fish poisoned by the anionic detergent sodium lauryl sulphate indicates that the nature of the toxic action changes at a concentration of about 120 mg l-1. Toxicity tests were conducted to determine whether this change could be detected

in the test data, using brown trout (Salmo trutta) and rainbow trout (S. gairdneri). Toxicity curves showed no indicaton of the change in toxic action, but at concentrations of 120 and 130 mg l-1 of sodium lauryl sulphate 'split' probit lines occurred, and the lines for 150 mg l-1 consistently differed in slope from other lines. SURVIVAL, DURATION OF LARVAL STAGES, AND SIZE OF POST-LARVAE OF GRASS SHRIMP, PALAEMONETES PUGIO, REARED FROM KEPONE CONTAMINATED AND UNCONTAMINATED POPULATIONS IN CHESAPEAKE BAY,
Old Dominion Univ., Norfolk, VA. Inst. of Oceanography
A. J. Provenzano, Jr. K. B. Schmitz, and M. A. Boston.
Estuaries, Vol. 1, No. 4, p. 239-244, 1978. 1 fig., 3 tab., 12 ref.

Descriptors: *Shrimp, *Toxicity, Larval growth stage, Chemical wastes, Industrial wastes, Reproduction, Chlorinated hydrocarbon pesticides, Water chemistry, Growth stages, Water temperature, Salinity, *Chesapeake Bay, Bioassay, *Kepone, Tissue analysis, Survival, *Palaemonetes.

Female grass shrimp and eggs from the James River had highest concentrations of Kepone (0.63 and 0.47 ppm, respectively) with sample from the Lafayette River at the mouth of the James River having the second highest levels (0.04 and 0.4 ppm). Concentrations in ovigerous females and eggs in the populations most distant from the James (mouth of Potomac and upper Potomac River) were at or below the limits of detectability (0.001 to 0.015 ppm). In laboratory reared postlarvae from each site, concentrations of Kepone were undetectable. Despite these apparent differences in Kepone concentrations in the various populations were found no significant difference in larval, larval duration, or length of post-larvae attributable to site of origin. Highly significant differences in larval duration and size of post-larvae were attributable to parental variation. (EIS-Deal)

EFFECTS OF THE INSECT GRWOTH REGULATOR DIMILIN (TH 6040) ON LARVAL DEVELOPMENT OF TWO ESTUARINE CRABS,
Oslo Univ. (Norway). Zoological Museum
M. E. Christiansen, J. D. Costlow, Jr, and R. J Monroe.
Marine Biology, Vol. 50, p. 29-36, 1978. 7 fig., 8 tab., 17 ref

Descriptors: *Crabs, *Animal pathology, *Pesticide toxicity, Insect control, Toxicity, Animal physiology, Animal metabolism, Mortality, Growth stages, Larval growth stage, Insecticides, Pesticide kinetics, *Dimilin, *Survival, *Zoeae, *Histology, *Tissue analysis

Effects of Dimilin, and ilnsect growth regulator which interferes with the formation of the insect cuticle, were studies on the larval development of Rhithropanopeus harrisii and Sesarma reticulatum (Crustacea: Brachyura). When larvae were exposed to 0.5 (R. harrisii only), 1,3,5,7, and 10 ppb Dimilin from hatching to the first crab stage, survival in both sepecies decreased in relation to increased concentrations of Dimilin. Survival of R. harrisii larvae was significantly lower at 1 ppb and higher levels compared with control experiments, and in S. reticulatum a significant decrease in survival began at the 3 ppb level. At 10 ppb Dimilin, lno larvae survived to the megalopa stage in either of the two specis. When R. harrisii larvae were treated with 10 ppb Dimilin during the intermolt period of each of the 4 zoeal stages, nearly all larvae died during molting to the succeeding stage. First zoeal larvae of R. harrisii exposed to 10 ppb Dimilin at various days during the intermolt period were more sensitive to the compound late than early in the period. It is suggested that Dimilin also may interfere with the formation of the cuticle in crab larvae. (EIS-Deal)

COMPARATIVE GROWTH, RESPIRATION AND DELAYED FEEDING ABILITIES OF LARVAL COD (GADUS MORHUA) AND HADDOCK (MELANO-GRAMMUS AEGLEFINUS) AS INFLUENCED BY TEMPERATURE DURING LABORATORY STUDIES,
National Marine Fisheries Service, Narragansett, RI. Narragansett Lab
G. C. Laurence
Marine Biology, Vol. 50, p 1-7, 1978. 4 fig, 2 tab, 29 ref.

Descriptors: *Water temperature, *Fish physiology, Fish reproduction, Fish behavior, Respiration, Growth rates, Feeding rates, Food habits, Larval growth stages, Fry, Mortality, Inhibition, Animal metabolism, Embryonic growth stage, *Cod, *Haddock.

Comparative growth and respiration were measured during the period hatching to metamorphosis for larval cod at 4, 7 and 10C and for haddock at 4, 7 and 9C. Growth was positively correlated with temperature for both species. Specific growth rates on a daily basis indicated good growth for the two species at the upper two temperatures and suppressed growth at 4C. Respiraton rates measured by oxygen consumption were similar for both species. Variable and elevated oxygen consumption at 4C indicated physiological stress at that temperature. Delayed feeding abilities, feeding initiation, yolk absorption and morphological development related to first feeding ability were similar for both species at 7 and 10C. Larvae could survive without food and still initiate feeding until 10 days after hatching at 7C and until 8 days at 9 to 10C. (EIS-Deal)
W79-03645

VASCULAR EFFECTS OF ACETYLCHOLINE, CATECHOLAMINES AND DETERGENTS ON ISOLATED PERFUSED GILLS OF PINK SALMON, ONCORHYNCHUS GORBUSCHA, COHO SALMON, O. KISUTCH AND CHUM SALMON, O. KETA,
Messina Univ. (Italy). Inst. of General Physiology.
L. Bolis, and J. C. Rankin
Journal of fish Biology, Vol. 13, p 543-547, 1978. 4 fig, 14 ref.

Descriptors: *Fish physiology, *Pink salmon, *Sockeye salmon, *Chum salmon, *Detergents, Salmon, Chemical properties, Chemical analysis, Linear Alkylate sulfonates, Toxicity, Spawning, Animal metabolism, Inhibition, *Acetylcholine, *Adrenaline, *Isoprenaline, *Vascular system, *Tissue analysis, *Propanolol, *Gills.

Acetylcholine caused vasoconstriction whilst adrenaline and isoprenaline caused vasodilation in isolated perfused Pacific salmon gills. The detergent LAS produced concentration dependent vasodilation when present in the perfusate in concentrations of 0.6 to 3 mg l-1. The effect of LAS was partly blocked by propranalol suggesting the involvement of B-Adrenergic receptors. The maximum responses obtained with acetylcholine, adrenaline or LAS were all much greater in sea water or pre-spawning freshwater fish than in spawning fish. (EIS-Deal)

ACCUMULATION OF THE ORGANOPHOSPHATE BLACKFLY LARVICIDE ABATE (TEMEPHOS) IN SAROTHERODON MOSSAMBICUS, WITH REFERENCE TO THE LARVICIDAL CONTROL OF SIMULIUM DAMNOSUM
Centre for Overseas Pest Research, London (England)
P. Matthiessen, and J. S. Johnson.
Journal of Fish Biology, Vol. 13, p 575-586, 1978. 2 fig, 3 tab, 28 ref

Descriptors: *Larvicides, *Organophosphorus pesticides, *Pesticide residues, Pesticide kinetics, Absorption, Diptera, Fish physiology, Animal metabolism, Biodegradation, Water chemistry, Path of pollutants, Fish food Organisms, Toxicity, Animal parasites, Human pathology, Public health, Insecticides, Tissue analysis, Bioaccumulation, *Temephos, *Abate, *Sarotherodon.

This paper describes the uptake and fate of the organophosphate larvicide Abate (temephos) in the tropical food fish, Sarotherodon mossambicus during exposure to concentrations (nominally 0.001-0.1 mg dm-3) similar to those being produced in West African rivers by the WHO Onchocerciasis Control Programme. S. mossambicus was able to absorb Abate both directly from the surrounding water, and by contaminated food. Maximum residue concentrations were proportional to dosage and were elevated in starving fish. Internal distribution depended on tissue fat content. Some fish produced the sulphoxide metabolite, and total residues diminished slowly during recovery. (EIS-Deal)

THE EFFECT OF COPPER, HARDNESS AND PH ON THE GROWTH OF RAINBOW TROUT SALMO GAIRDNERI.
Guelph Univ. (Ontario). Dept. of Zoology
K. G. Wakwood, and F. W. H. Beamish
Journal of Fish Biology, Vol. 13, p 591-598, 1978. 2 fig, 2 tab, 23 ref

Descriptors: *Copper, *Hardness(Water), *Hydrogen ion concentration, *Growth rates, *Rainbow trout, Fish physiology, Animal metabolism, Fish diets, Fish behavior, Inhibition, Toxicity, Copper compounds, Regression analysis, Metals, Water chemistry, Chemical analysis, Cupric ions.

Rainbow trout held at a fixed ration and activity regime were exposed to a number of copper, pH and hardness combinations. Growth rate, appetite and gross conversion efficiency were determined over three consecutive 10-day periods and partial or complete recovery was observed thereafter. For a given pH, less copper was required to reduce growth by a given amount at low than at high levels of hardness. At a given hardness, copper-induced depressions in growth rate were more pronounced and recovery slower in a low than in a high pH. No distinction could be made among total soluble or extractable copper but predicted concentrations of six specific cupric ions varied with pH and hardness. Regression analysis indicates that only $Cu2+$ and $CuOH+$ could be significantly correlated with growth rate. (EIS-Deal)

POLYCHLORINATED BIPHENYL (PCB) EFFECTS ON MARINE PHYTOPLANKTON PHOTOSYNTHESIS AND CELL DIVISION,

Stanford Univ., Pacific Grove, CA. Hopkins Marine Station.
L. W. Harding, Jr, and J. H. Phillips, Jr.
Marine Biology, Vol. 49, p 93-101, 1978. 3 fig, 2 tab, 50 ref.

Descriptors: *Polychlorinated biphenyls, *Toxicity, *Photosynthesis, *Phytoplankton, Marine algae, Cytological studies, Reproducton, Inhibition, Diatoms, Growth rates, Primary productivity, Aquatic populations, Chemical wastes, Chlorophyta, Water pollution effects, *Thalassiosira, Isochrysis, *Chaetoceros, *Skeletonema.

Inhibition of photosynthesis and cell division by polychlorinated biphenyls (PCBs) was studied using 7 marine phytoplankton species representing 4 algal classes. PCB concentrations as low as 1.0 microg l-1 reduced cell division of Thalassiosira pseudonana 3H and Isochrysis galbana. Both photosynthesis and cell division of T. pseudonana 3H, Chaetoceros socialis, Skeletonema costatum, T. pseudonana 13-1, Monochrysis lutheri and I. galbana were inhibited at a PCB concentration of 10.0 microg l-1. The effects on photosynthesis were immediate and probably resulted in reduced rates of cell division. Interspecific differences in susceptibility were observed. These differences have significance with respect to primary production and the species composition of phytoplankton communities. The initial slopes of photosynthesis-irradiance curves for the diatoms S. costatum and T. pseudonana 3H were reduced in the presence of PCBs. These results suggest that PCBs affect the photosynthetic light reactions. (EIS-Deal)

ROUTINE OXYGEN CONSUMPTION OF MUGIL CEPHALUS, LIZA DUMERILI AND L. RICHARDSONI AT DIFFERENT TEMPERATURES AND SALINITIES,

Port Elizabeth Univ. (South Africa). Dept. of Zoology.
F. K. Marais.
Marine Biology, Vol. 50, p 9-16, 1978. 7 fig, 2 tab, 1 ref.

Descriptors: *Oxygen, *Water temperature, *Salinity, *Mullets, Fish physiology, Animal metabolism, Fish behavior, Respiration, Diurnal, Fish populations, Biochemical oxygen demand, *Oxygen requirements, Starvation, Mugil, Liza.

Oxygen consumption studies were undertaken with 3 mullet species. It was found that handling had a profound influence on metabolic rate and led to considerably increased consumption rates during the first 8 h after introduction into the respiration chambers. Fasting in L. dumerili resulted in a total drop of 27% in oxygen consumption over a period of 6 days, of which 10% occurred over the first 24 h. Oxygen consumption displayed diurnal rhythms during the 6 day period, with lowest consumption rates at midday and midnight and highest just after sunrise and sunset. Patterns of oxygen consumption at different temperatures and salinity varied interspecifically. (EIS-Deal)

DISAPPEARANCE OF AROMATIC HYDROCARBONS AND ORGANIC SULFUR COMPOUNDS FROM FISH FLESH REARED IN CRUDE OIL SUSPENSION,

Okayama Univ. (Japan). Dept. of Public Health.
M. Ogata, and Y. Miyake.
Water Research, Vol. 12, p 1041-1044, 1978. 3 fig, 1 tab, 10 ref.

Descriptors: *Eels, Oil, *Oil pollution, Absorption, Aromatic compounds, Organic compounds, Sulfur compounds, Animal metabolism, Fish physiology, Sea water, Gas chromatography, Chemical analysis, *Crude oil, Tissue analysis, Bioaccumulation, *Depuration, *Benzene, *Toluene, *Xylene.

Eels (Anguilla japonica) were reared in sea water containing a crude oil suspension (50 ppm for 10 days for aromatic hydrocarbons, 2500 ppm for 3 days for organic sulfur compounds), then transferred to clean sea water. The disappearance of aromatic hydrocarbons and organic sulfur compounds from eel flesh was examined. Concentration ratio (concentration of eel flesh/concentration of water) of benzene, toluene, m- or p-xylene and o-xylene on 10 days is 3.5, 13.2, 23.6 and 21.4 respectively. Benzene, toluene, m-or p-xylene and o-xylene disappeared after the transfer to clean sea water, and half life period is 0.5, 1.4, 2.6 and 2.0 days respectively in first phase which lasted 0-5 days. Organic sulfur compounds in eel flesh decreased as the time spent in clean sea water increased, but were still present after 30 days. The results suggest that aromatic hydrocarbons and organic sulfur compounds could serve as markers of oil pollution in fish. (EIS-Deal)

INFLUENCE OF THE POLYCHLORINATED BIPHENYL PREPARATION AROCLOR 1242 ON COLOR CHANGES OF THE FIDDLER CRAB UCA PUGILATOR,

Tulane Univ., New Orleans, LA. Dept. of Biology
S. W. Fingerman, and M. Fingerman.
Marine Biology, Vol. 50, p 37-45, 1978. 8 fig, 1 tab, 25 ref.

Descriptors: *Polychlorinated biphenyls, *Crabs, *Pesticide residues, *Aroclors, Chemical wastes, Pesticide kinetics Chlorinated hydrocarbon pesticides, Chemical analysis, Animal physiology, Path of pollutants, Animal metabolism, Cytological studies, Biochemistry, Pigments, *Tissue analysis, *Melanin, Fiddler crab, Uca

The melanin in the melanophores of specimens of the fiddler crab, Uca pugilator, exposed to 2, 4, and 8 ppm solutions of the polychlorinated biphenyl (PCB) preparation, Aroclor 1242R, became less dispersed than in untreated specimens. This effect was dose-dependent. It was probably due to the PCB itself and not to polychlorinated dibenzofurans which are contaminants of commercial PCBs. The decreased melanin dispersion appeared to be related to a decrease in the rate of release of melanin-dispersing hormone from eyestalk neutoendocrine cells into the hemolymph. Eyestalks of crabs kept for 4 days in Aroclor 1242 contained 4 times as much melanin-dispersing hormone as did control crabs. When injected into isolated legs, hemolymph from crabs exposed to Aroclor 1242 produced less melanin dispersion than did hemolymph from control crabs. Aroclor 1242 did not appear to have a direct effect on the pigment-dispersing mechanisms of the melanophores. (EIS-Deal)

CADMIUM UPTAKE BY RAINBOW TROUT, SALMO GAIRDNERI EGGS AND ALEVINS,

University of Wales Inst. of Science and Technology, Cardiff. Dept. of Applied Biology.
J. H. Beattie, and D. Pascoe.
Journal of Fish Biology, Vol. 13, p 631-637, 1978. 4 tab, 21 ref.

Descriptors: *Rainbow trout, *Cadmium, *Fish eggs, *Fry, Biological membranes, Absorption, Adaptation, Fish behavior, Water chemistry, Chemical analysis, Toxicity, Heavy metals, Fish physiology, Animal metabolism, Fish diseases, Animal pathology, Bioaccumulation, Tissue analysis.

The uptake of cadmium by eggs and alevins of rainbow trout from water concentrations of between 0.01 and 50.0 mg Cd l-1 was investigated. The cadmium content of eggs and alevins increased with time and with exposure concentration. Lower cadmium levels were detected in alevins than in eggs. Most of the cadmium (98%) in the eggs was found to be associated with the egg membrane or chorion. This explains the considerable reduction in cadmium concentration observed in alevins after hatching. Alevins hatching from eggs which had been exposed to cadmium survived longer in cadmium than alevins not exposed as eggs. This suggests that the pretreatment of eggs with cadmium serves some protective function. Behavioural and pathological signs of cadmium poisoning such as erratic swimming and blood clotting in alevins were observed. (EIS-Deal)

ENHANCEMENT OF SOCKEYE SALMON (ONCORHYNCHUS NERKA) BY LAKE FERTILIZATION IN GREAT CENTRAL LAKE: SUMMARY REPORT,

Fisheries and Marine Service, Nanaimo (British Columbia) Pacific Biological Station
R. J. LeBrasseur, C. D. McAllister, W. E. Barraclough, O. D. Kennedy, and J. Manzer
Journal of the Fisheries Research Board of Canada, Vol. 39, 1978. p 1580-1596. 10 tab, 6 fig, 66 ref

Descriptors: *Lakes, Phosphates, Nitrates, *Food chain, *Sockeye salmon, Zooplankton, *Eutrophication, Nutrients, Fertilizer, Fertilization, *Primary production, Fish food, Organisms, Fish harvest, Fish populations, Fish production, Canada, *Grand Central Lake(BC)

Great Central Lake was treated with ca. 100t of commercial grade fertilizer (ammonium nitrate and ammonium phosphate) annually from 1970 through 1971. Limnological parameters and sockeye salmon juveniles and adults were monitored from 1969 through 1976 to test the hypothesis that increasing the supply of inorganic nutrients in an ultraoligotrophic lake would increase production at succeeding trophic levels. During fertilized years mean summer primary production increased fivefold, zooplankton standing stock increased 9 times, the percentage survival from estimated potential egg deposition to juvenile sockeye increased 2.6 times, while mean stock size of adult sockeye increased from < 50,000 to > 360,000. Adult sockeye returning to an adjacent untreated lake also increased in abundance. The data for the 8 yr

period support the initial hypothesis, but the dominant processes affecting production and interrelationships between different trophic levels in different years remain masked. (EIS-Katz)

THE EFFECTS OF COAL ASH BASIN EFFLUENT AND THERMAL LOADING ON BACTERIAL POPULATIONS OF FLOWING STREAMS,
Texas Univ. Health Science Center, Houston. School of Public Health
R. K. Guthrie, D. S. Cherry, F. L. Singleton, and R. S. Harvey
Environmental Pollution, Vol. 17, p 297-302, 1978. 1 fig, 1 tab, 11 ref

Descriptors: *Bacteria, *Water temperature, *Thermal pollution, Aquatic populations, Growth rates, Water quality, Trace elements, *Thermal powerplants, Cytological studies, Biological communities, Coals, Seasonal, Water chemistry, Industrial wastes, *Coal ash

Water quality parameters and elemental concentrations were studied for a period of one year in an ash basin drainage systems. Measurements were made in streams heated by thermal discharge from an electric power plant and in a non-polluted reference stream. Water samples from four stations were cultured for total culturable heterotrophic bacteria in the water column, number of chromagenic colonies and total number of different colony types (diversity). Both thermal loading and large concentrations of chemical elements from the coal ash basin reduced diversity and percentage chromagens, although increasing total culturable bacteria. Temperature appeared to have a greater effect on community stability characteristics than did increased elemental concentration on the naturally-occurring bacterial populations in these systems. Descriptors: Mixed forests, Ecology, Sewage effluents, *Sewage disposal, *Waste water disposal, Groundwater contamination, Phosphorus, Potassium, *New Hampshire, *Ecosystems, *Sunapee(NH), Mixed hardwood forest, Vegetative, Litter and soil components, Environmental measurements

A mixed hardwood forest at Sunapee, N.H. receiving applications of sewage effluent, was investigated for nutrient cycling characteristics in an attempt to determine the effect of the vegetation on renovation of wastewater. Biomass and nutrient pools were determined for all major vegetative, litter, and soil components in the sprayed forest and in a nearby control. Quantities and rates of transfer between these components were also determined. Both forests have high concentrations of nutrients in leaf tissue, yet low uptake amounts for all elements except P indicating that both were absorbing nutrients to their maximum capacity before spraying. No differences in concentration or productivity existed between the forests. As a result of spraying the forest composition is changing due to a high mortality of white pine. Alteration of normal litter dynamics did not inhibit removal of N, Ca, and Mg from the percolating water. Phosphorus and potassium, however, are leaching through to the lower soil layers in later summer, presenting a potentially dangerous threat of groundwater contamination.

BIOLOGICAL AND ECOLOGICAL STUDIES ON THE INTERACTION OF BDELLOVIBRIO AND ENTEROBACTERIACEAE,
Auburn Univ., AL
J. M. Westergaard.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 670, Price codes: A13 in paper copy, A01 in microfiche. Ph.D. Dissertation, 1977, 269 p, 44 fig, 66 tab, bibliography, 4 append. OWRT B-061-ALA(2).

Descriptors: *Pathogenic bacteria, Sewage bacteria, Aquatic bacteria, Microorganisms, Sewage treatment, E. coli, *Bdellovibrio, Coliforms, Enteric bacteria

Water samples collected from wells, ponds, streams, wastewater oxidation lagoon systems and municipal wastewater treatment plants were examined for both Bdellovibrio and parameters important for the growth of Bdellovibrio. Municipal wastewater was the best source for isolation of Bdellovibrio; the organisms was not isolated from well water. Bdellovibrio strains isolated from different aquatic ecosystems, soil and fish had a common antigen as expressed by the Complement Fixation Test and Immunodiffusion Test. Eight locally isolated Bdellovibrio strains had a relatively wide host range. Wastewater and .22 u pore size wastewater filtrates inoculated with equal numbers of Escherichia coli and of Bdellovibrio cells were tested at regular intervals for Bdellovibrio and total coliform counts during a 9-day period. Bdellovibrio were not isolated from fecal specimens sampled from domestic animals. It was concluded that Bdellovibrio was not a normal inhabitant of the intestinal microflora of animals, and that the organism could be considered a harmless bacterium for poikilothermal and homeothermal animals.

Availability of inorganic carbon in the form CO2 has been suggested as a limiting factor in growth of phytoplankton under conditions of hi pH. The effects of pH and bicarbonate alkalin on growth of the blue-green alga Anabaena va bilis and the green alga Scenedesmus obliq were measured under laboratory conditions. though both organisms had an initial high gro rate, Anabaena exhibited longer sustained gro which was enhanced by high pH and high bic bonate alkalinity. These results appear consist with the hypothesis that blue-green algae are be able to compete for inorganic carbon under th conditions. In the presence of bicarbonate, growth of both algae caused an alkalinization the medium by 1.2 to 2.6 pH units, which attributed to the uptake of bicarbonate, its conv sion to CO2, and the subsequent release of OH i the growth medium. A radiometric assay was veloped to measure carbonic anhydrase activity phytoplankton. With this assay the possible role carbonic anhydrase in the enzymatic conversion bicarbonate to CO2 in algae can be studied

Descriptors: *Polychlorinated biphenyls, * assay, Embryonic growth stage, Larvae, Aroc Rainbow trout, Channel catfish, Goldfish, fishes, Frogs, Toads, Bass, Dioctylphthalate, sononylphthalate, Polydimethylsiloxanes, Ter genesis

Static renewal bioassays were performed with polychlorinated biphenyls including Capacito and Aroclors 1016, 1242, and 1254. Each c pound was used to treat embryo-larval stage the rainbow trout (Salmo gairdneri), channel fish (Ictalurus punctatus), goldfish (Carassius tus), redear sunfish (Lepomis microlophus), l ard frog (Rana pipiens), Fowler's toad (Bufo leri), and American toad (Bufo americanus) velopmental stages of the trout were the sensitive, with LC50's at 4 days posthatchin 0.3, 1.0, 4.1, and 1.6 micro g l for Aroclors 1242, 1016, and Capacitor 21, respectively. ranged between 0.009-0.011 micro g l. Fow

oad was the most tolerant species, and LC50's aried from 3.7-28.0 micro g/l. Toxicity of the CB's generally increased with percent chlorine ubstitution. Bioassays also were conducted with ioctylphthalate (DOP), diisonoylphthalate, and ow Corning 561 silicone, three products proosed as replacements for PCB's. Embryos and rvae of the channel catfish, redear sunfish, leopard frog, and Fowler's toad were exposed rough 4 days posthatching. Catfish was the most ensitive species, and sunfish was the most resisnt. Based on LC50 values, replacement products ere found to be 2-5 orders of magnitude less toxic an PCB's. Continuous flow embryo-larval bioassays were performed on Capacitor 21 and DOP. est species included redear sunfish, rainbow out, and largemouth bass (Micropterus salmoides). Paralleling results from statis renewal sts, flow-through data reflected a vast difference toxicity between PCB's and potential replaceents. (Huffsey-Kentucky)

ffects of spray irrigation of treated municipal wage effluent on the forest floor and physical roperties of the soil were studied. Conducted on veral agronomic and forested areas in Central ennsylvania which had been irrigated with wage effluent for 14 years, the study included vo phases. Phase I investigated the effects of ray irrigation of treated municipal wastewater on e accumulation and decomposition of the forest oor. Phase II studied effects of spray irrigation of eated municipal wastewater on the physical propties of soil. Results indicated that spray irrigation wastewater increased the decomposition rates d decreased the accumulation of the forest floor. he increased decomposition rates of the forest oor were caused by increased moisture and temrature conditions at the forest floor-mineral soil terface and narrower C/N ratio of the litter. ray irrigation of wastewater also resulted in creased infiltration capacities of the Hublersburg t loam soil in the mixed hardwood and red pine rested areas and the reed canarygrass agronomic ea. No effect occurred on total or capillary posity; however, non-capillary porosity was lower the mixed hardwood, red pine, reed canarygrass, d corn areas. Spray irrigation of wastewater had effect on percolation capacity or bulk density. nk-Penn State)

FLUENCE OF BLUE-GREEN ALGAE ON IE PH AND BUFFER CAPACITY OF CULRE MEDIA,
wa State Univ., Ames. Dept. of Botany and nt Pathology.
B. Wildman, B. L. Benner, D. D. Held, and C. Schauberger.
oceeding Iowa Academy Science Vol 81 No 4 p 2-196, 1974. 7 fig, 33 ref. OWRT B-039-IA(3), B-3-IA(2).

escriptors: Buffer capacity, Algae, Anabaena cyJrica, Anacystis nidulans, Nostoc muscorum, *Cyanophyta, Hydrogen ion concentration, Cultures.

Three strains of the blue-green algae Anabaena cylindrica, Anacystis nidulans and Nostoc muscorum are able to adjust the pH of culture medium from stress levels (pH 4-6) to levels favorable for growth (pH 7-10). Over a period of one week, these strains increased the buffer capacity of their media with time. The pH of maximum buffer capacity after one week was very close to the pK2 of phosphoric acid. Algae grown in a medium initially buffered with Na2CO3 shifted the pH of maximum buffer capacity from the pK of carbonic acid to that of phosphoric acid.

MICROBIOLOGY-WATERBORNE OUTBREAKS, (LITERATURE REVIEW),
National Environmental Research Center, Cincinnati, OH.
G. F. Craun.
Journal Water Pollution Control Federation, Vol. 46, No. 6, p. 1384-1395, June, 1974. 89 ref.

Descriptors: *Microbiology, *Water pollution effects, *Diseases, Chemicals, *Reviews, *Bibliographies, Gastroenteritis, Typhoid, Hepatitis, Shigellosis, Salmonellosis, Amoebic meningoencephalitis, Naegleria fowleri, Cholera, Dracontiasis, Leptospirosis, Schistosomiasis, Shellfish poisoning.

A review was made by Craun and McCabe of the causes of waterborne-diseases occurring in the United States during the period 1946 to 1970. There were a recorded 358 outbreaks of diseases or poisoning from contaminated drinking water. Illnesses were of five major categories: gastroenteritis of unknown etiology (178 outbreaks), typhoid (53 outbreaks), infectious hepatitis (53 outbreaks), shigellosis (53 outbreaks) and salmonellosis (13 outbreaks). Seventy-one percent of the outbreaks resulted from the contamination of private, individual water systems, while 83 percent of the illness was a result of polluted community water systems. The distribution system of the community facilities was the major cause through cross-connections and back siphonage. Data indicate that waterborne diseases are on the increase during the last three decades. A slight increase in mortalities has occurred for gastritis, duodenitis, enteritis, and colitis in persons over 65, however, it is still significantly lower than was observed in the 1920's. R. A. Soltero, A. F. Gasperino, and W. G. Graham.
Verhandlunger Internationale Vereinigung fur Limnologie, Vol. 19, p. 1778-1789, November, 1975. 5 fig, 28 ref. OWRT A-058-WASH(5).

Descriptors: *Nutrients, Nitrate nitrogen, Orthophosphate, Density current, Primary productivity, Chlorophyll, Oxygen depletion, Phytoplankton, Zooplankton, *Eutrophication, *Washington, Long Lake(Wash), Water pollution effects.

Long Lake has become a popular recreational site, which has resulted in extensive development of permanent and weekend dwellings along its shores. However, in the last ten years, there has been complaints about the deterioration of the reservoir's water quality. Massive algal blooms and greater growths of aquatic macrophytes have been chief sources of concern. This investigaton was undertaken to determine the trophic status of Long Lake and to correlate changes in primary production to the physical and chemical environment in the reservoir. Changes in zooplankton populations were related to changes in phytoplankton populations.

Science, Vol 202, NO 4373, p 1183-1186, December 15, 1978. 2 tab, 13 ref. NSF DEB76-82283

Descriptors: *Lakes, *Carbon, *Nutrients, On-site data collections, On-site investigations, Eutrophication, Water quality, Organic compounds, Organic matter, Ecosystems, Watersheds(Basins), Forest watersheds, Urbanization, Limnology, Carbon flux.

Direct and indirect carbon fluxes in lakes Marion (British Columbia), Findley (Washington), Wingra (Wisconsin), and Mirror (New Hampshire) were compared, using budgets and input-output analysis. Overall differences in carbon flow between the lakes were shown with cycling indices of 0.031, 0.108, 0.572, and 0.661, respectively. The results suggested that lake ecosystems may be considered unique aggregations of similar components. (Sims-ISWS)

In: Southern California Ocean Studies Consortium Technical Paper No. 1, 'The Urban Harbor Environment', 1978. Presented at the First Southern California Ocean Studies Consortium Symposium, held Long Beach, California, on 16 April 1977. p 23-48, 4 fig, 3 tab, 47 ref.

Descriptors: *Coastal zone, *Resources development, *California, *Harbors, Trace metals, Pollutant identification, Sewage effluents, *Outer Continental Shelf, *Nearshore environment, Chlorinated hydrocarbons.

Recent studies which are relevant to understanding the combined and separate effects of coastal and harbor activities on chemical and biological conditions along the coast of southern California are summarized. The chemical summary presents new data on the coastal distribution of trace metals, chlorinated hydrocarbons and biological accumulation of some trace contaminants. Comments on biological effects focus on the now well studied soft bottom communities at open coastal discharge sites. Previous studies, including monitoring surveys, have generally centered around descriptions of the faunal complexities at individual waste discharge sites. In this paper (1) the biological similarities among large and small coastal discharge sites, particularly those which show promise as management tools and (2) which pollutants appear to be most important in causing the kinds of effects observed around most sewage discharge sites are explored. FATE OF OIL IN THE SEA,
Skidaway Inst. of Oceanography, Savannah, GA.
R F Lee
In: Proceedings of the 1977 Oil Spill Response Workshop, held Metairie, LA on 15-17 February 1977, Fish and Wildlife Service Biological Services Program Publication No. FWS/OBS/77-24, September 1977. p 43-54, 2 fig, 52 ref.

Descriptors: *Oil spills, *Oil pollution, *Water pollution effects, *Biodegradation, Coasts, Estuaries, Sediments, Weathering, Microbial degradation, Water quality control, *Outer Continental Shelf.

The fate of oil spills at sea depends on the composition of the oil, as well as such external factors as light and temperature. The extent of degradation also depends on the type of coastal area in which the spill occurs. In open, exposed coastline areas, with good circulation of water, most fractions of spilled oil are soon degraded. In protected shallow areas with less circulation, spilled oil is incorporated into sediments and much of it remains unaltered for many years. Photo-oxidation, dissolution, emulsification, adsorption to particles, biodegradation, and uptake by marine animals are not processes that act independently, but the interactions of all of these determine the fate of oil in water. The various filter feeders, grazers, and deposit feeders of the meiofauna and macrofauna utilize the organic matter of the sediment. In this process, they may expose deeper sediments to the water sediment interface where there is more microbial activity. The involvement of both microbes and animals in hydrocarbon degradation in marine sediments may be similar to their symbiotic association in recycling organic material in terrestrial sediments. ASSESSING THE BIOLOGICAL IMPACT OF OIL SPILLS: A NEW ROLE FOR EPA BIOLOGISTS,
Environmental Protection Agency Edison, NJ.
R. J. Nadeau.
In: Proceedings of the 1977 Oil Spill Response Workshop, held Metairie, LA on 15-17 February 1977, Fish and Wildlife Service Biological Services Program Publication No. FWS/OBS/77-24, September 1977. p 55-60.

Descriptors: *Oil spills, *Environmental effects, *Water pollution effects, *Oil pollution, Biota, Ecosystems, Mortality, *Outer Continental Shelf.

The effect that an oil spill has on aquatic ecosystems is influenced by a number of factors: type of oil spilled and volume, hydrography of the oil spill area, climatic and seasonal changes, indigenous biota, treatment methods used during the cleanup, and previous exposure to the spill area to oil pollution. Some of the specific effects that oil has on living systems or populations include but are not necessarily limited to, the following: death as a result of coating and asphyxiation; death through contact poisoning, death from exposure to water-soluble toxic compounds; destruction of sensitive juvenile forms; destructions of food sources or support populations, incorporation of sublethal amounts, resulting in the reduced resistance of species to infection or stresses; and incorporation of sublethal amounts, producing an off-flavor or taint in exploitable species, thereby causing an economic loss to man. Descriptors: *Oil petroleum, *Birds, *Water pollution effects, *Environmental effects, Ecosystems, Mortality, Analytical techniques, *Outer continental shelf, *Sublethal effects, Seabirds

There is some evidence of the impact of direct mortality from oil spills on bird populations, but very little is known about the sublethal and indirect effects of oil on birds. Research at the Patuxent Wildlife Research Center, Laurel, Maryland, is directed at (1) determining the effects of petroleum on the physiology and reproductive success of birds, and (2) developing the analytical methodology necessary for detection of petroleum in avian tissues. SYMPOSIUM: EXPERIMENTAL USE OF ALGAL CULTURES IN LIMNOLOGY; SANDEFJORD, NORWAY, 26-28 OCTOBER 1976.
Internationale Vereinigung fuer Theoretische und Angewandte Limnologie, Stuttgart (Germany, F.R.).
Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mittelungen No 21, Stuttgart, June 1978. 607 p. $40.00.

Descriptors: *Cultures, *Phytoplankton, *Limnology, *Algae, *Testing procedures, *Bioassay, *Limiting factors, Nutrients, Phosphorus, Nitrogen, Phosphates, Light intensity, Poisons, Toxicity, Culture media, Selenastrum capriconutum, Eutrophication, Water pollution effects, Laboratory tests, Methodology, Analytical techniques, Lakes, Plant growth, Growth rates, Bottle test, Pollutants, Absorption, Model studies, Succession, Algal growth potential, Water chemistry

Fifty-two papers include an introductory presentation, eight papers on methods, 17 on algal physiology, and 26 on applications. Rodhe in 1948 demonstrated the value of experimental cultures in studying the environmental requirements of algae. In 1960-62 the chlorophyte Selenastrum capriconutum, discovered in 1913, was evaluated experimentaly as a bioassay test organism, and in succeeding years was increasingly adopted in such studies, notably those assessing effects of toxic substances and nutrient enrichment. In 1971 it was establishe as a routine test organism in EPA's algal assa bottle test, and algal assays have become an impor tant method of evaluating water quality. Severa papers discuss testing techniques, including batch continuous, and semicontinuous cultures, the bottl test, turbidostats, and chemostats. Numerou papers report experimental results on limiting nu trients, nutrient stimulation of algal growth, an growth inhibition by toxic substances. Other sub jects include nutrient uptake kinetics, phytoplank ton growth cycles, light limitation, mathematica models, lipid surface films, bioaccumulation, bio vailability of nutrients, hot spring algae, pigment ecology, competition, zooplankton, succession, an growth regulators. Descriptors: *Algae, *Cultures, *Nutrients, *Ph toplankton, *Culture media, *Plant growth, Sele astrum capricornutum, Lakes, Limnology, Labor tory tests, Methodology, Laboratory equipmen Testing procedures, PAAP medium, Z8 mediu Limiting factors, Eutrophication, Bioassay

The history of efforts to create artificial cultu media of algae is reviewed in brief, and nutrition aspects of freshwater planktonic algal cultures discussed. Three tables compare the algae cultur of Beijerinck (1898), Chu 10 (1942), Rodhe V (1948), and Provasoli and Pintner for Synu (1953) with representative lake water compositi (derived from world average data). In most fres water, four cations (calcium, magnesium sodiu and potassium) and three anions (chlorine, sulfa and HCO3) constitute close to 100% of the to ionic content. In composing synthetic media, co centrations of growth-limiting nutrients are rais over natural levels and surplus constituents a reduced, since in algal cultures higher growth ra than in nature are usually desired. The two maj culture media for the common test alga, Selen trum capricornutum, are described: (1) Skulber Z8, and (2) the PAAP (formerly ASM) mediu developed by the Division of Applied Biology Ottawa, Canada. The two media contain virtua no common denominator of nutritional sign cance. Though the concept of a single limiti factor and Liebig's Law of the Minimum ha been shown to be inaccurate, the correct conc of several interdependent growth factors is still universally applied. THE EFFECTS OF SOME METALLIC IONS ON THE GROWTH OF CHLAMYDOMONAS VARIABILIS AND EUGLENA GRACILIS,
Paris-11 Univ. (France).
J. Bonaly, A. Delacourt, and J. C. Mestre.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandelfjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No 21, June 1978, p 103-109. 5 fig, 5 ref.

Descriptors: *Chlamydomonas variabilis, *Euglena gracilis, *Ions, *Heavy metals, *Growth rates, Toxicity, Plant growth, Algae, Phytoplankton, Lethal limit, Water pollution effects, Salts, Mercury, Cadmium, Chromium, Copper, Chlorophyta, Water quality standards.

The toxicity threshold of concentrations of various metallic ions was determined for two phytoplankters, Chlamydomonas variabilis and Euglena gracilis. The ions, including mercury (++), cadmium (++), chromium (6+), and copper (2+), were added to flasks containing 50 ml of axenic algal suspension, placed in a phytotronic basin with temperature fixed at 23C and continuous illumination at 5200 lux fluorescent light, and agitated at 1/min. Cell growth was determined by daily cell counting with a Cytograf 6301 or Coulter counter. Two types of toxic action could be distinguished in sublethal concentrations: (1) With mercury and chromium (6+) the growth curve gradient was not affected and, on the contrary, sublethal concentrations gave rise to a log-phase at the beginning of growth, the length of which varied directly with the level of the toxic substance; toxic threshold varied inversely with cell number/ml. (2) The increase of the cellular mitosis rate was proportional to the toxic concentration, resulting in a correlative decrease of the curve gradient in its exponential phase. The distinction between these two actions should not be overemphasized. The mechanism of toxicity were very low diverse and complex. A compound's toxic threshold is directly dependent on initial algal concentration, which must be kept in mind when setting water pollution standards. (See also W79-03842) (Lynch-Wisconsin)

THE EFFECT OF SEWAGE (MECHANICALLY, BIOLOGICALLY, AND CHEMICALLY TREATED) ON ALGAL GROWTH,
Vandkvalitetsinstitute, Hoersholm (Denmark).
E. Gargas.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No 21, June 1978, p 110-124. 7 fig, 6 tab, 8 ref.

Descriptors: *Guden River(Denmark), *Phytoplankton, *Sewage treatment, *Biological treatment, *Mechanical treatment, *Chemical treatment, Denmark, Lake Brass(Denmark), Lake Silkeborg Lang(Denmark), Secchi disks, Chlorophyll, Laboratory equipment, Growth rates, Plant growth, Water pollution effects, Eutrophication, Phosphorus, Batch cultures, Bioassay, Nutrients, Algae, Rivers, Lakes, Selenastrum capriconutum, Chlorophyta.

In-situ and laboratory batch algal assay experiments were carried out to determine effects of various types of sewage treatment on algal growth in the River Guden system, Denmark. The River Guden flows from Lake Brass through the eastern part of Lake Silkeborg Lang, where it receives primary treated sewage from the Soholt treatment plant. Since sewage treatment (90% chemically-based) would only marginally increase Secchi depth, due to phosphorus inputs from sources other than the treatment plant. Total nutrient loading must be reduced to significantly improve water quality in the lake. In laboratory experiments, Selenastrum capricornutum was tested in water from Lake Brass, to which mechanically or biologically/chemically treated sewage was added at different concentrations. Field measurements were carried out in Lake Brass in 300-liter polyethylene bags filled with untreated lake water to which sewage was added. In laboratory tests, sewage loadings caused an increase in potential production; algal biomass increased with increasing sewage loadings, particularly when water was spiked with mechanically treated sewage. During field tests it was not possible to estimate the effect of sewage loadings on natural phytoplankton population growth. Effects of 0%, 5%, and 10% loading of mechanically or biologically/chemically treated sewage on Secchi depth in the two lakes is given. (See also W79-03842) (Lynch-Wisconsin)

ON THE KINETICS OF LIGHT-LIMITED GROWTH OF SCENEDESMUS PROTUBERANS FRITSCH AND ECOLOGICAL IMPLICATIONS,
Amsterdam Univ. (Netherlands). Lab. for Microbiology.
H. J. Gons, and L. R. Mur.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No 21, June 1978, p 125-135. 5 fig, 1 tab, 13 ref.

Descriptors: *Scenedesmus protuberans, *Kinetics, *Light intensity, *Growth rates, *Limiting factors, *Plant growth, Temperature, Algae, Phytoplankton, Ecology, Monod equation, Photoperiodism, Batch cultures, Photorespiration, Absorption, Chlorophyta.

The growth of the chlorophyte Scenedesmus protuberans in light-limiting conditions was studied in continuous cultures, and the relationship between specific growth rate (mu) and light intensity (I) in dilute suspensions was measured. The relationship between mu and the specific light uptake rate (dE/dt-1/X) was diphasic and linear at both 20 and 28C at low light intensities; at high light intensities additional phases were distinguished. The phases are: (1) a linear relationship at low light intensity and uptake rate, (2) the onset of photorespiration at a certain light intensity (dependent on temperature), (3) attainment of full physiological potential at which point further increase of light intensity has no further effect, and (4) the point at which light becomes damaging and growth is inhibited. An improved light irradiance measurement method developed subsequent to presentation showed that average light intensities and specific light uptake rates were underestimated by a magnitude of three; qualitative conclusions are nevertheless unaffected. One-liter cultures in cylindrical double-walled Pyrex vessels were illuminated by circular fluorescent lamps on a light-dark cycle of 16 and 8 hours. Average light intensity was determined by measurement of light intensity in empty vessels (with water between the walls) at fixed points on the inner surface. (See also W79-03842) (Lynch-Wisconsin)

GROWTH CYCLE OF A FRESHWATER DIATOM,
Miliostyrelsen, Silkborg (Denmark). Freshwater Lab.
C. Hunding.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No 21, June 1978, p 136-146. 6 fig, 24 ref.

Descriptors: *Nitzschia palea, *Diatoms, *Biorhythms, *Photosynthesis, *Photoperiodism, *Growth stages, *Light intensity, Life cycles, Algae, Periphyton, Plant growth, Light, Cell number, Cell volume, Microalgae, Darkness, Growth rates, Semicontinuous cultures, Limnology, Chrysophyta.

The growth cycle of the freshwater periphytic diatom Nitzschia palea was studied in semicontinuous laboratory culture to illustrate some aspects of their behavior as a natural population and to determine the precise sequence of events when cells are cultured in alternating light and dark periods of 12 hours each. Microalgae tend to be synchronized in their cell development under natural light regimens, and significant diurnal variations in such cell characteristics as the rate of photosynthesis, increase in cell number and cell volume, and chlorophyll-a concentration may be expected to occur in natural populations. The findings are important to pollution studies, since the microalgae apparently are more sensitive to various stress factors at some stages of their life cycles than at others. The light-dark growth cycle induced a periodicity in the algal culture. The increase rate of cell particle number was 3.3/day, with two distinct periods of increased growth rate: (1) beginning about seven hours after the start of the light period, and (2) beginning about four hours after the start of the dark period. The average size of cell particles decreased during periods of high growth rates, while the size range increased. At the onset of light the algal population consisted almost exclusively of small cells. Photosynthetic rate increased exponentially during early light, but was significantly reduced when cells sampled at the beginning of dark were exposed to a high quantum flux. LIGHT-LIMITED CULTURES OF THE BLUE-GREEN ALGA OSCILLATORIA AGARDHII,
Amsterdam Univ. (Netherlands). Lab. for Microbiology.
L. Van Liere, and L. R. Mur.
In: Symposium: Experimental Use of Algal Cul-

tures in Limnology, 26-28 October 1976. Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie. Mitteilungen No 21, June 1978. p 158-167. 7 fig, 3 tab, 10 ref.

Descriptors: *Oscillatoria agardhii, *Phytoplankton, *Light intensity, *Limiting factors, *Plant growth, *Growth rates, Algae, Cyanophyta, Light, Cultures, Batch cultures, Chemostats, Succession, Eutrophication, Scenedesmus protuberans, Lakes, Model studies, Mathematical models, Kinetics, Energy budget, Equations

Cultures of the cyanophyte Oscillatoria agardhii were grown under light-limiting conditions to study growth kinetics, in part to permit comparison with kinetics of the chlorophyte Scenedesmus protuberans to explain the succession of green to blue-green algae in eutrophic lakes. A model developed by Gons and Mur (1975) to describe growth in light-limited conditions was used (dE dt)c = muX + (mu sub e) X, where dE dt is the absorbed light energy, c is the efficiency factor, X is biomass, mu is the specific growth rate constant, and mu sub e is the specific maintenance rate constant. In batch cultures, three surface light intensities were tested with fluorescent illumination: 0.5, 2.5, and 4.8 W sq m. Maximal cell density increased sharply with light intensity up to 2.5 W sq m, at which point the slope of the curve flattened. However, the energy absorbed per unit dry weight increased linearly with light intensity, leading to the conclusion that more energy per unit dry weight is needed at higher light intensities, which may have an effect on mu sub e, when c is a constant. In chemostat experiments, especially at high light intensity, changes in light intensity, temperature, pH, and dilution rate sometimes had persistent traumatic effects. Processes which decrease efficiency (c), such as photorespiration and spillage of ATP or reductants, are dependent not only on growth rate, but also on the time cell is exposed to light. High light intensity repressed pigment synthesis. (See also W79-03842) (Lynch-Wisconsin)

SELENIUM AS A MICRONUTRIENT FOR THE DINOFLAGELLATE PERIDINIUM CINCTUM FA. WESTII.

Uppsala Univ. (Sweden). Inst. of Limnology
K. Lindstrom, and W. Rodhe
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976. Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie. Mitteilungen No 21, June 1978. p 168-173. 4 fig, 1 tab, 1 ref.

Descriptors: *Peridinium cinctum fa westii, *Dinoflagellates, *Selenium, *Nutrients, *Plant growth, *Culture media, *Limiting factors, Phytoplankton, Algae, Lake Kinneret(Israel), Israel, Lake Erken(Sweden), Sweden, Micronutrients, Bioassay, Testing procedures, Methodology, Photosynthesis, Growth rates, Lakes, Pyrrophyta

Discovery of selenium as the essential growth factor in water of Lake Kinneret, Israel enabled the first successful culture of the dinoflagellate Peridinium cinctum fa. westii by Carefoot (1968) in a medium supplemented with vitamins, trace metals, and water from the lake. Using an entirely mineral medium (Lindstrom no. 9), a maximum specific growth rate of 0.16 was reached at 50 ng Se l., giving a half-saturation constant (K sub s) of 7.5 ng Se l. Increase of cell numbers in the Lindstrom no. 9 synthetic medium was comparable to the Carefoot medium with water from Lake Erken, Sweden. More than 15,000 cells/ml was attained after 58 days, while controls without selenium failed to yield significant cell numbers. Addition of selenium to Lake Erken water at 158 ng/l almost tripled the yield after 69 days, indicating that, in addition to being an indispensable constituent of Peridinium, selenium may limit its production in nature. When other nutrients were in surplus, selenium concentration was the exclusive determinant of the production of living cells, final cell yields as empty shells, and rates of oxygen production. Selenium also determined gross photosynthetic oxygen production which exceeded 600 pg O2 cell/hr at selenium concentrations over 30 ng/l. A bioassay procedure is described which permits determination of selenium concentrations in lake water down to about 5 ng/l. It is believed that the primary effect of selenium for this alga is enzymatic. (See also W79-03842) (Lynch-Wisconsin)

THE MECHANISMS OF CARBON DIOXIDE FIXATION IN PHYTOPLANKTON.

Bigelow Lab. for Ocean Sciences, West Boothbay Harbor, ME.
L. Morris, J. Beardall, and D. Mukerji
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976. Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie. Mitteilungen No 21, June 1978. p 174-183. 3 fig, 4 tab, 21 ref. NSF DES 75-15104, DES 75-22128.

Descriptors: *Phytoplankton, *Carbon dioxide, *Photosynthesis, *Pathways, *Phaeodactylum tricornutum, *Skeletonema costatum, *Dunaliella tertiolecta, Carbon, Marine algae, Diatoms, Flagellates, Chlorophyta, Algae, Primary productivity, Carbon radioisotopes, Metabolism, Carboxylases, Tracers, Bicarbonates, Ions, Fixation

Three marine algae, Skeletonema costatum, Phaeodactylum tricornutum, and Dunaliella tertiolecta, were used to study the path of carbon assimilation during photosynthesis, specifically: (1) the short-term pattern of C14-carbon dioxide fixation, (2) activities of carboxylases in cultures of marine algae, (3) correlation between changing photosynthetic rates and carboxylase activities, and (4) carbon dioxide species used by carboxylases. The mechanism of photosynthetic carbon dioxide assimilation in some marine algae differs from that generally assumed to operate in algae. Certain conclusions are suggested by the fact that the central features of the short-term pattern of carbon dioxide fixation correlate with the relative activities of RuDP Case/PEP Case, and that these features vary among algae and with the physiological state of the cells. (1) Under certain conditions some marine algae (especially diatoms) fix the bicarbonate ion through an active PEP Case, the C3 acceptor for this fixation is regenerated by a decarboxylation reaction which provides carbon dioxide for fixation by the RuDP Case of the Calvin cycle. (2) Under other conditions certain marine algae (especially green flagellates) fix carbon dioxide directly by the RuDP Case with quantitatively less fixation occurring by the PEP Case reaction. The ability of an alga to regulate a switch from a C3 mechanism to a C4 mechanism of CO2 fixation under changing environmental conditions might be important in species selection among phytoplankton populations. PHOSPHORUS KINETICS--ALGAL GROWTH RELATIONSHIPS IN BATCH CULTURES.

Toronto Univ. (Ontario).
C. Nalewajko, and D. R. S. Lean.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976. Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie. Mitteilungen No 21, June 1978. p 184-192. 5 fig, 2 tab, 15 ref.

Descriptors: *Batch cultures, *Phosphorus, *Kinetics, *Phytoplankton, *Plant growth, *Testing procedures, *Perturbation experiments, *Steady-state experiments, Growth rates, Algae, Absorption, Phosphates, Nutrients, Ababaena flos-aquae, Scenedesmus quadricauda, Navicula pelliculosa, Nutrient flux, Cyanophyta, Chlorophyta

Axenic cultures of Anabaena flow-aquae, Navicula pelliculosa, and Scenedesmus quadricauda were used as inocula for batch cultures to (1) ascertain if phosphate exchange between algal cells and the medium was as important as earlier work suggested, and (2) to compare the perturbation and steady-state approaches to phosphate uptake kinetics. Data confirm that phosphate movement is not one-way entry from medium to algal cells, but rather an exchange, and even during early logarithmic growth the influx may greatly exceed net phosphate uptake. In contrast to the earlier studies the same culture was used to follow net uptake and influx of phosphate. Turnover times of the phosphate pool in the medium were not as short as reported previously. The shortest turnover time (28.6 min) was detected in the Ababaena culture on the sixth day of growth, compared to 2.7 min for that species in the earlier study. A possible explanation is that experimental duration in the present study was not as long as in the earlier ones and therefore phosphate limitation was not as severe. Although phosphate turnover times in the cultures do not approach the fastest lake water values, it is still concluded that algae as well as (or rather than) bacteria are responsible for the fast phosphate uptake in lakes. K sub s values for the three species ranged from 10-400 micrograms PO4-P/l and increased markedly during growth as phosphate depletion occurred. V sub max decreased with increasing growth rate and with increasing cell phosphorus content. (See also W79-03842) (Lynch-Wisconsin)

A MATHEMATICAL MODEL FOR GROWTH OF PHYTOPLANKTON.

Novo Industri A/S, Bagsvaerd (Denmark)
N. Nyholm
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976. Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie. Mitteilungen No 21, June 1978. p 193-206. 2 fig, 4 tab, 4 ref.

Descriptors: *Phytoplankton, *Mathematical models, *Kinetics, *Eutrophication, *Lakes, *Algal growth, Algae, Denmark, Shallow water, Biomass, Dry weight, Nutrients, Phosphorus, Nitrogen, Limiting factors, Growth rates, Forecasting, Depth, Water temperature

A kinetic phytoplankton growth model is presented as a submodel for predicting eutrophication in receiving waters in a shallow pond, using data from the Guden River system, Denmark. Currently in use at Denmark's Water Quality Institute, the model has proved useful for simulating algal growth in several shallow, eutrophic lakes. The model treats phytoplankton as a single unit and ignores individual species. Growth is described as average growth of biomass dry weight; the model does not account for diurnal rhythms. Phosphorus and nitrogen alone are potential limiting nutrients. Specific growth rate at a particular depth is expressed as a function of light intensity, day length, temperature, and intracellular concentrations of nitrogen and phosphorus. Under limiting conditions, instantaneous nutrient uptake is assumed, while the transition regime the uptake rate is assumed proportional to the extracellular substrate concentration, and with conditions of surplus nutrient, nutrient uptake is proportional to growth of mass. A logic incorporated into the model ensures no discontinuities during intergration of the mass balance equations. The dynamic description of nutrient dependence makes it possible to predict that a large algal standing crop can develop and maintain a comparatively high production rate in an environment of very low dissolved nutrients. ungen No. 21, June 1978, p216-223. 3 fig, 3 tab, 17
ef.

Descriptors: *Scenedesmus quadricauda, *Plant
norphology, *Pleomorphism, *Coenobia, *Uni-
ells, Algae, Cultures, Phosphorus, Nutrients, Pho-
operiodism, Biorhythms, Cytological studies,
Buoyancy, Ecology, Survival, Chlorophyta.

Manipulation of environmental conditions pro-
uced various degrees of morphological change in
pleomorphic strain of the chlorophytic alga
cenedesmus quadricauda. Three morphologically
able synchronized culture systems were achieved
hich yielded either coenobia or unicells: (1) only
our-celled coenobia were formed in synchronized
ultures grown at 30C in a medium containing
800.5 mg/l total inorganic salts; (2) partially syn-
hronized cultures consisting of two-, four-, and
ight-celled coenobia developed when grown at
0C in a medium containing 130.5 mg/l total inor-
anic salts; and (3) a completely synchronized
norphologically stable unicell-yielding culture
ystem was achieved at 20C with high nutrient
evels (1800.5 mg/l). Cultures were synchronized
ith 14-hr light and 10-hr dark cycles, and were
luted daily with fresh nutrient medium to the
riginal cell density of about 400,000 cells/ml.
ncreasing the nutrient levels in System 2 failed to
eld a unicellular system, but in System 3 shorten-
g day length to three hours changed the system
partly coenobial. Spiny Scenedemus species are
ble to produce both unicellular and coenobial
ages, as observed in both natural and laboratory
opulations. Phosphorus enrichment is known to
ve rise to unicell production, as does a relatively
ng photoperiod. This pleomorphism may favor
rvival of the organism as the relative buoyancy
unicells or coenobia enable them to seek surface
bottom nutrient-rich waters, respectively. (See
so W79-03842) (Lynch-Wisconsin)

s, *Storage, *Eutrophication, *Balgavies
och(Scotland), Lakes, Scotland, Nutrients, Ana-
ena cylindrica, Anabaena flos-aquae, Phyto-
ankton, Algae, Water pollution effects, Biomass,
hlorophyll, Plant growth, Polyphosphate bodies,
ructured granules, Polyhedral bodies, Plant mor-
ology.

oor correlation between blue-green algal biomass
d levels of dissolved nitrogen and phosphorus in
e water column of Balgavies Loch, Scotland is
rtially due to the ability of cyanophytes to accu-
ulate and store cellular reserves of nitrogen,
osphorus, and other material. They may store a
riety of compounds intracellularly in nontoxic
rm and as discrete bodies which they can mobi-
e readily if required. In particular, their ability to
cumulate structured granules and polyphosphate
dies provides a supply of ribulose 1,5-diphos-
ate carboxylase, the key enzyme for photosyn-
etic carbon fixation. Accumulation of these com-
unds and others such as lipoid droplets may be
ucial in sustaining the algae because: (1) they
ay sustain growth when exogenous sources of
trients are limiting, which helps explain how
gal blooms develop when nutrient supplies are
parently depleted; (2) accumulation of storage
dies when algal growth is declining may explain
w nonporulating algae (such as Microcystis
w-aquae) sustain themselves during winter; and
the ability to accumulate nutrients in one area
and use them in other areas of the water column is probably an ecological advantage. Anabaena cylindrica and A flos-aquae were used in laboratory experiments. (See also W79-03842) (Lynch-Wisconsin)

COMPOSITION AND PROPERTIES OF LIPID SURFACE FILMS PRODUCED BY CHLORELLA PYRENOIDOSA,
Lund Univ. (Sweden). Limnological Inst.
A. Sodergren.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Thoretische und Angewandte Limnologie, Mitteilungen No. 21, June 1978, p 248-253. 1 fig, 1 tab, 17 ref.

Descriptors: *Chlorella pyrenoidosa, *Lipids, *Surface films, *Fatty acids, *Acids, *Sampling, Algae, Chlorophyta, Continuous flow, Batch cultures, Air-water interfaces, Lakes, Oceans, Phytoplankton, Chromatography, Research equipment, Methodology, Microlayers, Spectrometers, Organochlorine compounds, Polychlorinated biphenyls, Fungicides, Pollutants, Water pollution effects, On-site tests.

The lipid surface film produced by the chlorophytic alga Chlorella pyrenoidosa in continuous-flow and batch cultures was collected with a teflon plate technique (Larsson, et al 1974) and examined by thin-layer and gas chromatography and by mass-spectrometry. To study the composition of the film and to follow organic compounds produced within the cultures, $NaH^{14}CO_3$ was added as a tracer. Myristic acid, palmitic acid, stearic acid, and oleic acid were found in quantities of 2-63 ng/sq cm, with palmitic acid the dominating constituent among free fatty acids, and the pattern of fatty acids in the film was different from that in the algae. Film properties were studied by introducing the lipophilic substances hexachlorobenzene (a fungicide) and hexachlorobiphenyl (a PCB) into the cultures. The major part of these compounds was taken up by the algae, but the surface film also accumulated large amounts. The compounds were transported to the surface film even though the lagae were separated from the surface of the culture by a glass fiber filter. Accumulation in the surface film partially explains previously reported losses when lipophilic pollutants were tested in aquatic systems. The accumulation mechanism in the surface film must be considered when water is sampled for organochlorine residue analysis. (See also W79-03842) (Lynch-Wisconsin)

ACCUMULATION OF LEAD BY SEVERAL GREEN ALGAE,
Staatsinstitut fuer Allgemine Botanik, Botanischer Garten und Anzuchtgarten Fuhlsbuettel, Hamburg (Germany, F.R.).
A. Weber, M. Melkonian, D. W. Lorch, and M. Wettern.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No. 21, June 1978, p 254-260. 2 fig, 3 tab, 22 ref.

Descriptors: *Chlorophyta, *Absorption, *Bioaccumulation, *Lead, *EDTA, *Food chains, *Toxicity, *Heavy metals, Desorption, Pediastrum tetras, Pediastrum boryanum, Pediastrum duplex, Fritischiella tuberosa, Chlorella pyrenoidosa, Pollutants, Water pollution effects, Algae, Ions, Metabolism, Light, Oxygen.

Three species of Pediastrum (P. tetras, P., boryanum, and P. duplex) did not accumulate significant amounts of lead when treated with Pb-EDTA, but Chlorella pyrenoidosa concentrated the metal at a factor of 2800 and Fritschiella turberosa at a factor of 120. Of the lead accumulated, 85-95% could be desorbed by treatment with 0.001 M sodium-EDTA solution. Lead concentration by C. pyrenoidosa from Pb-EDTA was oxygen-dependent and was enhanced by light. The Pediastrum species concentrated lead at factors of 1700-7000 when applied in the ionic form $Pb(\quad)$. Chlorophyta thus show considerable variation in lead-concentrating capability; the algae investigated will be incorporated into a model food chain to study possible toxic accumulations at higher trophic levels. Lead concentration from Pb-EDTA may be due to either metabolic processes of the algae or to physico-chemical instability of the complex in the culture media used. The three Pediastrum species were cultured axenically in a modified Bold Basal Medium, and the other two species in a mineral medium according to Kessler and Czygan (1970). Aqueous stock solutions of lead (II) nitrate (pH 1) and lead-EDTA at 1 mg Pb/ml) were used; lead was added to the culture media either before or after autoclaving at 1 mg Pb/ml. In desorption experiments, lead-treated algae were harvested by a continous-flow centrifuge, washed, and inoculated into the sodium-EDTA solution. (See also W79-03842) (Lynch-Wisconsin)

N-UPTAKE AND PIGMENTATION OF N-LIMITED CHEMOSTAT CULTURES AND NATURAL POPULATIONS OF OSCILLATORIA AGARDHII,
Amsterdam Univ. (Netherlands). Lab. for Microbiology, Amsterdam (Netherlands).
W. Zevenboom, and L. R. Mur.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. International Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No. 21, June 1978, p 261-274. 5 fig, 3 tab, 29 ref.

Descriptors: *Oscillatoria agardhii, *Pigments, *Nitrogen, *Limiting factors, *Eutrophication, *Absorption, Lakes, Netherlands, Wolderwijd(Netherlands), Veluwemeer(Netherlands), Algae, Cyanophyta, Nutrients, Bioassay, Light, Plant growth, Growth rates, Half-saturation constant, Plant physiology, Kinetics, Nitrates, Succession.

Experiments with the cyanophyte oscillatoria agardhii in chemostate and natural populations taken from two shallow, eutrophic Dutch lakes (Wolderwijd and Veluwemeer) in summer and fall of 1975-76 demonstrate that nitrogen, in addition to light, can become the limiting factor in eutrophic fresh waters. The experiments verified a hyperbolic relationship between nitrogen uptake rate and nitrogen concentration. The chemostat was particularly useful for investigation of relationship between limiting factors and algal succession. Conclusions: (1) the half-saturation constant for nitrate values of the cells varied progressively with the growth rate in the nitrate-limited chemostat cultures, and was therefore not a constat at all; (2) no variation in the ammonia half-saturation constant values was observed fo nitrate-and ammonia-limited cells; (3) the maximum uptake rate for nitrate and ammonia was a constant common value; (4) the observed lag time in nitrate uptake by nitrate-starved cells leads to a distinction between nitrate limitation and nitrate starvation (ammonia limitation); (5) pigmentation and nitrogen content of nitrogen-limited chemostate cultures was low compared with data for light-limited cells; (6) pigment and nitrogen content correlated positively with growth rate of the nitrogen-limited chemostate cultures, indicating good regulation of pigmentation and nitrogen content in response to changes in ambient nitrogen levels; and (7) nitrate-limited cells have higher pigment content than ammonia-limited cells. TESTING OF SUBSTANCES FOR THEIR TOXICITY THRESHOLD: MODEL ORGANISMS MICROCYSTIC (DIPLOCYSTIS) AERUGINOSA AND SCENEDESMUS QUADRICAUDA,
Bundesgesundheitsamt, Berlin (Germany, F.R.) Inst. fuer Wasser-, Boden-, und Lufthygiene
G. Bringmann, and R. Kuhn
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandef-

jord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie. Mitteilungen No. 21, June 1978, p 275-284. 1 tab, 5 ref

Descriptors: *Microcystis aeruginosa, *Scenedesmus quadricauda, *Toxicity, *Pollutants, *Water pollution effects, *Bioassay, *Testing procedures, Algae, Chlorophyta, Cyanophyta, Methodology, Inorganic compounds, Organic acids, Aliphatic esters, Aromatic esters, Alcohols, Bioindicators.

A chlorophyte (Scenedesmus quadricauda) and a cyanophyte (Microcystis aeruginosa) were selected as model algae to test relative inhibitory effects of 180 pollutants, including 20 inorganic compounds, 11 organic acids, 24 aliphatic and aromatic esters, and 22 alcohol. The minimum inhibitory concentration (toxicity threshold) of 60% of the pollutants was lower for Microcystis than for Scenedesmus. In seven cases toxicity threholds for Scenedesmus exceeded those for Microcystis by two logs, in 45 cases by one log, and in 56 cases by up to one log. In 42 cases (23%) toxicity thresholds were about equal for the two species, and in 30 cases (17%) thresholds were higher for Microcystis than for Scenedesmus. It is recommended that both organisms be used in pollutant bioassays. The species were chosen as characteristic of cyanophytes and chlorophytes. All substances tested are listed with the toxicity threshold in mg/l for each alga, together with the ratio between the two, with microcystis set at 1.0. In the experiments the cell multiplication inhibition test was used. Since cell multiplication involves the entire metabolism, the result is total coverage of damaging effects of a hazardous water pollutant upon algae, in contrast with inhibition tests based on special physiological processes. The procedure is briefly described. (See also W79-03843). (Lynch-Wisconsin)

ANATOXINS FROM CLONES OF ANABAENA FLOS-AQUAE ISOLATED FROM LAKES OF WESTERN CANADA,
Alberta Univ., Edmonton. Dept. of Botany
W. W. Carmichael, and P. R. Gorham
In: Symposium: Experimental Use of Algal Culture in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No. 21, June 1978, p 285-295. 3 fig, 2 tab, 36 ref.

Descriptors: *Canada, *Lakes, *Anabaena flos-aquae, *Toxins, *Anatoxins, *Cyanophyta, *Poisons, *Livestock, *Stock water, Alberta(Canada), Saskatchewan(Canada), Algae, Toxicity, Lethal limit, Phytoplankton, Microcysis aeruginosa, Microcystin, Plant morphology

Investigation of several cases of algae poisoning of livestock and other animals over the past 15 years in lakes of Alberta and Saskatchewan, in western Canada, has resulted in isolation of four types of anatoxins (designated a-d) from clones of the cyanophyte Anabaena flos-aquae taken from blooms from six sources. These six blooms were: (1) Burton Lake, Saskatchewan, June 1961, type a; (2) Echo Lake, Saskatchewan, 1963, type b(S); (3) Buffalo Pound Lake, Saskatchewan, June 1965, type a(S); (4) Disney Lake, alberta, June 19721, type b; (5) Beaverhill Lake, Alberta, September 1972, type C; and (6) Bendig's Pond, Saskatchewan, August 1975, type d. The qualifier (S) indicates a variationproducing severe salivation and lachrymation. Axenic clones were obtained by repeated cloning using the method of Carmichael and Gorham (1974). Lethal limit and symptoms were determined using lyophilized cultures in mice, rats, and chicks. Photomicrographs of the anatoxins from the six clones are included. The anatoxins' minimum lethal doses for mice I.D sub min (i.p.m.) are 60 for types a-c, and 10 for type d. Mouse survival times were 4-5 min for type a, 8-12 min for type b, 1-2 hrs for type c, and 4-10 min for type d. Of effects indentified, three are most indicative of the different toxins: (1) longer survival time--type c; (2) opisthotonous--typs a and a(S)--which is characteristic of post-synaptic neuromuscular depolarization compouns; and (3) chromodacryorrhea (bloody tears)--type d--which is characteristic of anticholinesterase compounds. THE BIOGEOGRAPHY OF HOT SPRINGS ALGAE THROUGH ENRICHMENT CULTURES,
Oregon Univ., Eugene. Dept. of Biology
R. W. Castenholz.
In: Symposium: Experimental Use of Algal Culture in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mittelungen No. 21, June 1978, p 296-315. 5 fig, 1 tab, 28 ref

Descriptors: *Biogeography, *Algae, *Hot springs, *Cyanophyta, *Mastigocladus laminosus, *Cultures, HTF Mastigocladus, Synechococcus lividus, Oscillatoria terebriformis, Spirulina labyrinthiformis, Chloroflexus aurantiacus, Prokaryotes, Israel, Water temperature, Yellowstone Nation Park(WY), Wyoming, Oregon, Montana, Canada, Zaire, Alaska, Arkansas, Mexico, Central America, Japan, New Zealand, Iceland, Azores, Italy, Czechoslovakia, Greece.

Thermophilic blue-green algae were collected from hot springs in western Canada, the United States, Mexico and Central America, Japan, New Zealand, Iceland, the Azores, Italy, Czechoslovakia, Greece, Israel, Zaire, and Uganda to clarify some questions of distribution and dispersal. Thermophilic algae, those able to grow at constant temperatures of 45C or over, form a group of species with distinct global distribution limits. The only phototrophic organisms which grow in hot springs above about 45-50C and pH above 5.0 are cyanophytic algae and anoxygenic photosynthetic bacteria; both are prokaryotes. Dispersal is thought to involve simple airborne transport by insects and birds. Hot springs were systematically examined, live collections were studies microscopically, and selective or enrichment cultures were used for many of the specis, usually followed by unialgal or clonal isolations to permit detailed comparative studes. Enrichment conditions included high temperataure alone, high or low temperature combined with lack of fixed oxygen, media with ammonium nitrogen or a calcium carbonate sediment, and agar medium for motile forms. Mastigocladus laminosus was the most widespread species, easily confused with a high temperature form (up to 62-64C), designated HTF Mastigocladus, also widespread. Synechococcus lividus had lesser survival abilities, though it was not as restricted as the very sensitive oscillatoria terebriformis. Spirulina labyrinthiformis was conspicuously absent from Iceland, the Azores, and New Zealnd. (See also W79-03842). (Lynch-Wisconsin)

EFFECTS OF RIVER DISCHARGE ON THE COASTAL PHYTOPLANKTON CYCLE,
Norwegian Fisheries Directoriate, Arendal, Statens Biological Station
E. Dahl.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereingung fur Theoretische und Angewandte Limnologie, Mittelungen No. 21, June 1978, p 330-341. 11 fig, 15 ref

Descriptors: *Fjords, *Frierfjord(Norway), *Skein River(Norway), *Discharge(Water), *Phytoplankton, *Eutrophication, *Thermal powerplants, Coasts, Algae, Rivers, Langesund Bay(Norway), Zooplankton, Norway, Primary productivity, Carbon radioisotopes, Baseline studies, Life cycles, Water pollution effects, Heated water, Cool water, Chlorophyll, Salinity, Brackish water

Studies of the phytoplankton cycle in the Frier jord on Norway's southeast coast February 197 August 1976 showed that cold freshwater d charge from the Skein River produces a patte distinct from that of the open coast. In the Frie jord there is a large summer phytoplankton ma mum, but no spring diatom bloom as is found March at the open coast. A transition zone b tween the Frierfjord and the coast tends to bo spring bloom and summer maximum. The summ maximum in the Frierfjord is due to discharge nutrients, higher temperatures, and longer upho ing of the surface layer. The lack of a spring blo is due to short upholding of the surface layer a low temperature, hwich contribute to low grow rates. Few or no phytoplankton species can rep duce themselves rapidly in water characterized sonstat salinity changes. The Skien River has annual mean water flow of 300 cu m/sec, initiates a surface current of brackish water n ning through the branched fjord system towa the coast. Heated cooling water from a propo thermal power plant would raise temperatures the brackish productive layer of the Frierfjord thereby increase production throuhout the y especially in spring. The heated discharge co probably be constructed to prolong the uphold of the backish layer, and waste heat could be u to improve the outer fjords for recreation. also W79-03842). (Lynch-Wisconsin)

Descriptors: *Long Lake(WA), *Zinc, *Bioassay, *Phytoplankton, *Bottle test, *Industrial wastes, Smelters, Domestic wastes, Selenastrum capricornutum, Anabaena flos-aquae, Sphaerocystis schroeteri, Cultures, Algae, Cyanophyta, Chlorophyta, Standing crops, Eutrophication, Heavy metals, Pollutants, Runoff, EDTA, Chelation, Nutrients.

The algal assay bottle test was a useful method of predicting indigenous phytoplankton standing crop in eutrophic Long Lake, Washington, an impoundment of the Spokane River polluted by domestic and smelter waste discharges. Conclusions from the 1974-75 studies: (1) Zinc is the dominant heavy metal affecting laboratory cultures of Selenastrum capricornutum grown in Long Lake waters. (2) Surface water runoff directly influences heavy metal concentrations in the lake. (3) Increased growth of Selenastrum and Anabaena flow-aquae in EDTA-spiked lake sample can be directly attributed to chelation of zinc. (4) Sphaerocystis schroeteri, the dominant chlorophyte isolated from the lake, produced its maximum yield without addition of EDTA; the indigenous phytoplankton standing crop is not adversely affected by the zinc. (5) Selenastrum maximum yield correlated well with naatural phytoplankton standing crop and chlorophyll-a as well as with the chemically analyzed limiting nutrient. (6) Indigenous phytoplankton standing crop was limited by the primary limiting nutrient content of ambient water (whether phosphorus or nitroen). (7) Phytoplankton biomass in the lake was limited by nitrogen 57% of the samples, and secondarily by phosphorus (3% of the samples). In the remaining samples the primary limiting nutrient could be determined. (8) Zooplankton grazing may have affected species dominance, but did not significantly affect algal standing crop. Laboratory methods involving simple apparatus (20-liter glass jars) were used to study phytoplankton ecology in filtered water samples from Loch Creran, a sea-loch on Scotland's west coast. Earlier work in the loch itself was complicated by patchiness and water movement. The laboratory cultures were multispecific, continuous, and exposed to a natural illumination cycle. Nine experiments were carried out 1974-75, lasting 1-40 days. With use of a large inoculum, a phytoplankton population that was similar to natural populations in the loch could be grown in the culture vessels 5-30 days. Skeletonema coastatum grew well as expected, but Eucampia zodiacus and Cerataulina pelagica, typical of open water, also grew surprisingly well. A 'normal' population was maintained for the longest time with moderate nutrient enrichments coupled with dilution of about 0.2/day. The cultures were used to investigate nutrient status, cell division cycles, and microzooplankton grazing. Use of Droop's nutrient growth model (experiment H) suggested that nitrogen is more likely than phosphorus to control phytoplankton growth in Loch Creran. Culture inocula were taken from a depth of 2-4 m in the loch using 8-liter plastic bottles. A normal population was broadly defined as occurrence of typical sea-loch species, their growth in parallel with the same species in the loch, coherence of growth curves, and the maintenance of moderate diversity. In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No. 21, June 1978, p 473-479. 5 fig, 11 ref.

Descriptors: *Cyanophyta, *Chlorophyta, *Oscillatoria agardhii, *Scenedesmus protuberans, *Competition, *Light intensity, *Growth rates, *Limiting factors, Turbidity, Phytoplankton, Algae, Succession, Lake, Eutrophication, Plant growth, Phosphates, Turbidity, Shading.

Research about competition between the chlorophyte alga Scenedesmus protuberans and the cyanophyte Oscillatoria agardhii indicate that light is the most important factor regulating blue-green algal blooms. Light distribution in water is greatly influenced by phytoplankton shading; increased concentration of the limiting factor will increase turbidity and favor organisms adapted to low light intensities. Since in freshwater phosphate is the limiting factor, phosphate inputs would therefore stimulate cyanophyte growth. Turbidity is caused by suspended materials and phytoplankton; the latter is more important in most cases. Maximal growth rate (mu sub max) of Scenedesmus was found to be 1.58/day, much higher than that of Oscillatoria (0.864/day). The level of limiting incident light intensity for Oscillatoria is 25 W/sq m, and for Scenedesmus about 85 W/sq m. Scenedesmus' maximal growth rate range is 30-85 W/sq m, while for Oscillatoria the range is 6-25 W/sq m. At a light intensity lower than two W/sq m Oscillatoria reached a higher growth rate than Scenedesmus. Experimental results are compared to data for the Randmeren Lakes in the Netherlands, where the optimum layer of Scenedesmus was 5-14 cm, and of Oscillatoria was 16-28 cm. In these shallow lakes Scenedesmus growth is impossible at the extinction of 0.05 or higher by a shortage of energy, but Oscillatoria can grow under such conditions. MODELING OF N- AND P- UPTAKE BY SCENEDESMUS ACUTUS, WITH REGARD TO TERTIARY TREATMENT OF DOMESTIC WASTE WATER,
Ghent Rijksuniversiteit (Belgium). Faculteit Landbouwwetenschappen.
H. R. E. Paelinck, and J. De Maeseneer.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No. 21, June 1978, p 480-489. 4 fig, 15 ref.

Descriptors: *Scenedesmus acutus var. alternans, *Tertiary treatment, *Waste water treatment, *Nitrogen, *Phosphorus, *Nutrient removal, *Mathematical models, Algae, Phytoplankton, Chlorophyta, Model studies, Absorption, Equations, Domestic wastes, Nutrients, Nitrates, Phosphates.

A model of tertiary wastewater treatment using the chlorophyte alga Scenedesmus acutus var. alternans considers not only the nutrient removed by treatment but also its relationship to other nutrients. The model represents a practical rather than a physiological appraoch to nutrient removal. Nitrate and phosphate uptake was studied in semicontinuous cultures, renewed after 24 hrs growth. Cultures remained vigorous throughout the experiment. Results showed relationships among initial phosphorus and nitrogen concentrations, dry wt, residual phosphorus and nitrogen, and phosphorus and nitrogen uptake. In this model nutrient uptake is well-established within limits of the experimental design, and extrapolation to other conditions of temperature, illumination, cell concentration, etc. is not possible. Functional equations derived to determine the quantity of dry weight which must be produced to eliminate a certain amount of nutrient (nitrogen or phosphorus) are given graphically. At nitrogen uptake values over 20 ro phosphorus uptake values over 300 laboratory cultures have difficulty maintaining themselves. Additional treatment under such conditions would be necessary for complete nutrient removal. Carbon dioxide could also become limiting under field conditions. (See also W79-03842) (Lynch-Wisconsin)

GROWTH EXPERIMENTS WITH MARINE PLANKTON ALGAE: THE ROLE OF 'WATER QUALITY' IN SPECIES SUCCESSION,
Oslo Univ (Norway) Dept of Marine Biology and Limnology.
E Paasche
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No. 21, June 1978, p 521-526. 2 fig, 1 tab, 14 ref.

Descriptors: *Seasonal, *Succession, *Marine algae, *Water quality, *Oslofjord(Norway), *Bioassay, *Eutrophication, Algae, Phytoplankton, Plant growth, Metals, Salts, Limiting factors, Norway, Seasonal, Diatoms, Chrysophyta, Lauderia annulata, Skeletonema costatum, Thalassiosira nordenskioeldii, Water chemistry, EDTA, Nitrates, Phosphates, Silicates, Chelation, Fjords.

Experiments with cultures of three representative planktonic marine diatom species grown in seawater samples from the inner Oslofjord, Oslo, Norway and enriched with nitrate, phosphate, and silicate, did not support the hypothesis that phytoplankton succession is influenced by variations in water quality. The study suggests that the only variations in chemical properties of the water likely to influence succession are seasonal changes in inorganic nutrient salts, such as nitrate or silicate. There was no indication that substances inhibitory to diatom growth were produced by any algae in the highly eutrophic inner Oslofjord, despite the presence of several algal species which grew to high densities. Growth of the three species in the test cultures--the widespread Skeletonema costatum, the cold-water species Thalassiosira nordenskiodeldii, and the warm-water species Lauderia annulata--was not restricted to any particular season. For example, Skeletonema grew no faster in May-June, the normal period of abundance, than at other times. Addition of EDTA to the water did not improve diatom growth. Metals present in soluble form appeared to be adequately balanced by naturally occurring chelators; according to several authors water quality is largely determined by the degree of complexation of trace metals. RELATIONSHIP BETWEEN ALGAL PHOSPHORUS EXTRACTION AND WATER PHOSPHORUS CONCENTRATION,
FMC Corp., Princeton, NJ. Research and Development Center
J. Saldick, and S. E. Coleridge.
In: Symposium Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No. 21, June 1978, p 547-554. 6 tab, 11 ref

Descriptors: *Soluble reactive phosphorus, *Phosphorus, *Algae, *Bioassay, *Absorption, *Ceratophyllum, Macrophytes, Nutrients, Phosphates, Streams, Lakes, Indiana, Connecticut, Illinois, New York, Oedogonium, Hydrodictyon, Cladophora, Selenastrum capricornutum, Chlorophyta, Aquatic plants, Plant growth, Bottle test, Water chemistry, Phytoplankton.

Algae and macrophytes were sampled in streams and lakes in New York, Connecticut, Indiana, and Illinois 1973-75 during an environmental studies program of FMC Corporation for analysis of soluble reactive phosphorus (SRO) content of plants and water. Cladophora, Oedogonium, Hydrodictyon, and Ceratophyllum gave good linear correlations between SRP extracted from the plants and SRP in the ambient water. The macrophyte Ceratophyllum yielded relatively more extracted SRP than did the algae. SRP concentrations in the water 1-2 weeks prior to harvesting affected the quantity of SRP extracted. SRP in the indigenous Cladophora varied with geographic location. Subsequent experiments included: (1) algal assays with the EPA bottle test using the chlorophyte Selenastrum capricornutum; (2) harvesting of Cladophora (Chlorophyta) June 1975 from streams in Erie County, New York, and relocating to phosphorus-rich or phosphorus-poor streams where they were suspended in nylon mesh bags 15 cm below the surface for 1-2 days to assess SRP uptake; and (3) harvesting of Cladophora from a low-phosphate stream in New York (less than five micrograms SRP/1) and transplanting to lakes in Indiana and central New York. Transplantation of phorphorus-poor Cladophora into phosphorus-rich streams for 24-48 hrs gave 0.1-2.0% extractable SRP. (See also W79-03842) (Lynch-Wisconsin)

THE ALGAL GROWTH POTENTIAL OF AN INLAND SALINE AND EUTROPHIC LAKE,
North Dakota Univ., Grand Forks. Dept. of Biology
L E Shubert
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No. 21, June 1978, p 555-574. 22 fig, 6 tab, 64 ref.

Descriptors: *Eutrophication, *Devil's Lake(ND), *Algal growth potential, *Limiting factors, *Nutrients, *Saline lakes, *Sewage disposal, North Dakota, Lakes, Nitrogen, Phosphorus, Bioassay, Chlorella, Chlorophyta, Cyanophyta, EDTA, Trace elements, Glucose, Organic matter, Alkalinity, Shallow lakes, Water level fluctuations, Water pollution effects, Salinity, Algae, Bioindicators, Culture media.

Algal growth potential and limiting nutrients were bioassayed in Devil's Lake, a saline, alkaline (pH 8-9), eutrophic, shallow (mean depth five meters) lake in northeastern North Dakota. Evaporation exceeds precipitation, causing water level fluctuations and changes in salinity. Surface water samples were collected bimonthly from nine stations in the 23,200-ha lake during 1974-75. Water chemistry was determined, and the chlorophyte Chlorella DL 7-24-01 was used in the bioassays with Devil's Lake medium, a synthetic nutrient medium formulated on the basis of lake water sample analysis. Algal growth was measured daily, and for limiting tests, cultures were spiked with one of eight nutrient combinations involving nitrogen as sodium nitrate, phosphorus as K_2HPO_4, a trace element mixture, EDTA, and glucose. Algal growth was highest July-August with maximum temperatures and solar radiation; cyanophyta were dominant, especially Microcystis aeruginosa and Aphanizomenon flosaquae. Overall growth averaged 1.91 cell doublings every 48 hrs August 1974 to August 1975. In spiked cultures, growth stimulation overall was statistically significant with EDTA alone, nitrogen/phosphorus, and all nutrients together except glucose. During July and August no additions stimulated growth. High nutrient levels in the lake are partially due to sewage inputs. (See also W79-03842) (Lynch-Wisconsin)
W79-03891

SORPTION AND CONCENTRATION OF TAXIC MINERALS BY MASS CULTURES OF CHLOROCOCCALES,
Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Dortmund (Germany, F.R.).
C J Soeder, H D Payer, K H Runkel, J Beine, and E. Briele
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. International Vereinigung fu Theoretische und Angewandte Limnologie, Mitte lungen No. 21, June 1978, p 575-584. 2 fig, 6 tab, 1 ref

Descriptors: *Sorption, *Lead, *Cadmium, *Pollutants, *Coelastrum proboscideum, *Scenedesmus acutus var. alternans, Chlorphyta, Poisons, Toxicity, Hydrogen ion concentration, Thailand, West Germany, Mass cultures, Cultures, Bioassay, Algae, Phytoplankton, Water pollution sources, Air pollution, Potable water, Fertilizers.

Lead and cadmium sorption by the green alga Coelastrum proboscideum was studied in laboratory and greenhouse cultures, and accumulation of several toxic minerals in the biomass of the chlorophyte Scenedesmus acutus var. alternans was compared under outdoor conditions in Bangkok, Thailand, and Dortmund, West Germany. Upon exposure to a medium containing 0.5-1.0 ppm lead at C, Coelastrum biomass contained 1400-2200 pp lead (dry wt) after a few hours. The sorption ra was reduced by lower temperature and high concentrations of calcium and magnesium in t medium, but not influenced by inhibitors of phot synthesis or phosphorylation. Cadmium sorptio potential was lower; growth in a medium conta ing 40 ppb cadmium resulted in a maximal conce tration in the alga of 25 ppm. Cadmium sorptio increased with pH. In the outdoor experimen (1972-73), Scenedesmus was grown in mass cu tures yielding 10-20 g dry matter/sq m/day. Ha vested material was dried, analyzed for lead, ca mium, mercury, antimony, selenium, tin, arsen and bromine, and the relative contribution of pollution, tapwater, and fertilizer was statistica determined. This method is suitable for evaluati a site's overall pollution load. The Dortmund d indicated arsenic and cadmium came mainly fr fertilizer; tapwater was the major source of b mine, mercury, and tin, and air pollution of le and antimony. THE ROLE OF NUTRIENT COMPETITION A PREDICTIVE THEORY OF PHYTOPLAN TON POPULATION DYNAMICS,
Minnesota Univ., St. Paul Dept of Ecology a Behavioral Biology
D. Tilman.
In: Symposium: Experimental Use of Algal C tures in Limnology, 26-28 October 1976, Sand jord, Norway. Internationale Vereinigung Theoretische und Angewandte Limnologie, Mi lungen No 21, June 1978, p 585-592. 1 fig, 25

Descriptors: *Phytoplankton, *Population dyna ics, *Silicates, *Limiting factors, *Monod equati *Competition, *Model studies, Algae, Cyclot meneghiniana, Asterionella formosa, Forecasti Mathematical models, Lakes, Great Lakes, L Michigan, Diatoms, Chrysophyta, Half-saturat constant, Plant growth, Growth rates, Nutrie Plant physiology, Equations.

Previous work utilizing the Monod physiolog model of species competition for a nutrient is tended to help develop a more general theory phytoplankton population growth. Experim measuring competition for phosphate and sili by the diatoms Asterionella formosa and Cy tella meneghiniana showed little difference maximal growth rate, but results showed that

formosa was significantly better than C. meneghiniana at growing under phosphate limitation while the reverse was true under silicate limitation. That is, A. formosa had a significantly lower half saturation constant for phosphate-limited growth, and C. meneghiniana for silicate-limited growth. The Monod model was remarkably accurate in predicting the outcome of the two species grown together at various supply ratios of silicate and phosphate. Asterionella was dominant where both species were phosphate limited, Cyclotella was dominant where both species were silicate-limited, and coexistence was stable where each was limited by a different nutrient. Relative abundance of the two species in Lake Michigan along a natural gradient of silicate and phosphate was then predicted, assuming steady-state concentrations of extracellular nutrients. Four additional factors may affect species distribution: (1) nutrient physiology of major species, (2) nutrient supply rates, (3) species-specific mortality rates, and (4) physical factors such as temperature, light, pH, and major ions. CHANGES IN SUCCESSION RATE IN A NATURAL PHYTOPLANKTON COMMUNITY FOLLOWING NUTRIENT ENRICHMENT,
Stockholm Univ. (Sweden). Inst. of Botany.
L. Tinnberg.
In: Symposium: Experimental Use of Algal Cultures in Limnology, 26-28 October 1976, Sandefjord, Norway. Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Mitteilungen No 21, June 1978, p 593-599. 4 fig, 9 ref.

Descriptors: *Nutrients, *Eutrophication, *Brunnsviken(Sweden), *Phytoplankton, *Succession, *Limiting factors, *Succession rates, Algae, Sweden, Baltic Sea, Bays, Water pollution effects, Sewage disposal, Diversion, Brackish water, Forecasting, Nitrates, Phosphates, Species composition, Batch cultures, Oscillatoria agardhii, Cyanophyta.

Calculation of the phytoplankton succession rate 1973-75 in Brunnsviken, a small, isolated, brackish bay of the Baltic Sea in Stockholm, Sweden, showed one minimum during the spring bloom in April, and another beginning in June-July caused by a bloom of the cyanophyte Oscillatoria agardhii. Succession rates calculated from laboratory cultures can be used to predict effects of changes in nutrient levels on natural phytoplankton populations during summer stagnation. Depletion of nitrate and phosphate occurred during the cyanophyte bloom, and addition of these nutrients increased succession rates from July-October. From November-February the succession rate was high both under natural conditions and in batch cultures, making it difficult to evaluate the effect of enrichments by calculating succession rates. Sewage effluents were diverted from the bay in 1969, and during the summer stagnation of 1974 phosphate and nitrogen depletion reached limiting levels for some phytoplankton for the first time since diversion. Succession rate was used in this study as a measure of the rate of change in phytoplankton species composition. Samples were collected from a depth of 0.5 m with a 1.5-liter Ruttner sampler approximately biweekly, phytoplankton were counted, and total volumes were calculated for each species. To determine the limiting nutrient, batch culture tests were carried out on natural phytoplankton sampled biweekly. (See also W79-03842) (Lynch-Wisconsin)

CORRELATIONS BETWEEN SPECIFIC ALGAE AND HEAVY METAL BINDING IN LAKES,
Ottawa Univ. (Ontario). Dept. of Biology.
F. Briand, R. Trucco, and S. Ramamoorthby.
Journal of the Fisheries Research Board of Canada, Vol 35, p 1482-1485, 1978. 1 fig, 2 tab, 16 ref.

Descriptors: *Heavy metals, *Diatoms, *Chlorophyta, *Mercury, *Copper, *Lead, *Cadmium, Biomass, Phytoplankton, Nutrients, Physicochemical properties, Water chemistry, Chemical analysis, Phosphates, Aquatic algae, *Bioaccumulation.

Long-term experiments conducted at Heney Lake, Quebec, show the binding capacity for the metal ions Cu2+, Hg2+, Pb2+, and Cd2+ to be related to algal species composition rather than to total algal biomass or physicochemical parameters. Most of the binding could be accounted for by certain species of green algae, diatoms, and chrysomonads that usually constituted only a minor fraction of the total algal volume. (EIS-Deal)

CULTURE STUDIES ON THE EFFECTS FROM FLUORIDE POLLUTION ON THE GROWTH OF MARINE PHYTOPLANKTERS,
British Columbia Univ., Vancouver (British Columbia). Dept. of Botany.
L. Oliveira, N. J. Antia, and T. Bisalputra.
Journal of the Fisheries Research Board of Canada, Vol 35, p 1500-1504, 1978. 1 fig, 1 tab, 21 ref.

Descriptors: *Growth rates, *Fluorides, *Toxicity, Diatoms, Dinoflagellates, Phytoplankton, Inhibition, Metabolism, Water chemistry, Water analysis, Chemical analysis, Industrial wastes, Nutrients, Salinity, Sea water, Marine phytoplankton.

The autotrophic growth of 12 species of marine phytoplankters, from eight classes of algae, was tested on axenic cultures with NaF additions of 0-100 mg F/L. All species showed good growth without indication of toxicity or adaptation lag. The highest fluoride concentration caused 25-30% growth-rate inhibition of a diatom, a dinoflagellate, and a haptophyte; other diatoms and species from other classes of algae were virtually unaffected. It is hypothesized that the unexpected lack of toxicity from F- ion may be due to the formation of innocuous complexes with one or more ions of seawater. The ecological inference is drawn that fluoride pollution may be readily tolerated by some marine phytoplankton under nutrient-sufficient conditions. (EIS-Deal)

A STEADY-STATE PHYTOPLANKTON MODEL OF CHESAPEAKE BAY,
Hydroscience, Inc., Westwood, NJ.
H. J. Salas, and R. V. Thomann.
Journal Water Pollution Control Federation, Vol. 50, p. 2752-2770, 1978. 15 fig, 2 tab, 8 ref.

Descriptors: *Model studies, *Mathematical models, *Phytoplankton, *Chesapeake Bay, Eutrophication, Chlorophyll, Biomass, Nutrients, Nitrogen, Phosphorus, Growth rates, Productivity, Municipal wastes, Water quality, Water chemistry, *Susquehanna River.

A quasi-linearized, steady-state model of nutrient-phytoplankton interactions is constructed for the Chesapeake Bay system to provide a first basis for allocation of nutrient discharges. The results of the data and model evaluations indicate that phosphorus is more important than nitrogen in limiting phytoplankton growth in the Chesapeake Bay proper above the Potomac River. The most significant sources of nutrients to the bay are from the Baltimore metropolitan area and the Susquehanna River. First estimates of the reaction coefficients were obtained from approximation to the nonlinear theory and then further refined using the two years of data. Estimates of the impact on phytoplankton biomass, as measured by chlorophyll a, as a result of reduced phosphorus discharges are determined from the model for different regions of the bay (EIS-Deal)

LYSOSOMAL RESPONSES TO EXPERIMENTALLY INJECTED ANTHRACENE IN THE DIGESTIVE CELLS OF MYTILUS EDULIS,
Institute for Marine Environmental Research, Plymouth (England).
M. N. Moore, D. M. Lowe, and P. E. M. Fieth.
Marine Biology, Vol. 48, p. 297-302, 1978. 1 fig, 2 tab, 17 ref.

Descriptors: *Cytological studies, *Toxicity, *Mussels, Animal physiology, Animal metabolism, Aromatic compounds, Chemical analysis, Biochemistry, Enzymes, Digestion, Commercial shellfish, *Anthracene, *Tissue analysis, Mytilus, *Lysosomes.

Experimentally injected anthracene has been shown to induce dose-dependent lysosomal destabilisation and release of hexosaminidase in the digestive cells of Mytilus edulis after 24 h. This destabilisation was accompanied by cytological evidence of cytolysis of the digestive cells. The destabilising effect of 100 microgram of onjected anthracene persisted for 96 h with a return to the control condition by 168 h. These results are discussed in the content of environmental contamination by polycyclic aromatic hydrocarbons. (EIS-Deal)

237PU EXPERIMENTS WITH THE PLAICE PLEURONECTES PLATESSA,
Ministry of Agriculture, Fisheries and Food, Lowestoft (England). Fisheries Radiobiological Lab.
R. J. Pentreath.
Marine Biology, Vol. 48, p. 327-335, 1978. 5 fig, 6 tab, 13 ref.

Descriptors: *Radioisotopes, *Isotope studies, *Fish physiology, Radioactivity, Radioecology, Radioactive wastes, Tracers, Animal metabolism, Digestion, Absorption, Crabs, Path of pollutants, Growth stages, Chemical analysis, Radiochemical analysis, *Plutonium, *Paice, Pleuronectes, *Tissue analysis, *Bioaccumulation.

Several experiments have been performed on the metabolism of 237Pu - a high specific activity, gamma-emitting isotope of plutonium - by the plaice Pleuronectes platessa. Very little of the isotope was incorporated into fish after 2 months exposure to labelled water. The oral retention from a variety of labelled foods was also very poor, and apart from the gut itself no incorporation of the isotope could, in fact, be demonstrated. Injected 237Pu was eliminated very slowly, and some evidence was obtained for an inverse relationship between the rate of 237Pu loss and the rate of growth of the fish. Growing fish incorporated a relatively larger fraction of the 237Pu body burden into skeletal material, and this was attained at the expense of the isotopic content of the liver. Very little 237Pu was incorporated into muscle. (EIS-Deal)
W79-03901

THE IMPORTANCE OF THE TIME FACTOR IN THE RESPONSE OF ZOOPLANKTON TO VARYING CONCENTRATIONS OF NATURALLY OCCURRING PARTICULATE MATTER,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Marine Ecology Lab.
P. Mayzaud, and S. A. Poulet
Limnology and Oceanography, Vol 23, No 6, p 1144-1154, 1978. 7 fig, 1 tab, 37 ref.

Descriptors: *Food habits, Model studies, *Copepods, *Food abundance, Mathematical models, Zooplankton, Animal behavior, Feeding rates, Animal populations, Food chains, Biomass, Enzymes, Biochemistry, Chemical analysis, Proteins, *Pseudocalanus, *Tissue analysis, Particulate matter

Over the course of a year a linear relationship was found between feeding rates of five species of neritic copepods and their probable food supply, the naturally occurring particulate matter. However, a saturation-type curve was obtained when a range of food concentration was offered to Pseudocalanus minutus over a short period of time (18-20h). Digestive enzyme levels of the copepod population were also found to vary linearly on a seasonal basis. The affinity appeared to vary with time, indicating acclimation in the digestive system. A new model, linear for variations of food concentrations over an extended period of time (weeks to a year) and curvilinear for variations over a time smaller than the one needed for acclimation, is developed. (EIS-Deal)

POLYCHLORINATED BIPHENYL (PCB) UPTAKE BY MARINE PHYTOPLANKTON.
Stanford Univ., Pacific Grove, CA. Hopkins Marine Station
I. W. Harding, Jr., and J. H. Phillips, Jr.
Marine Biology, Vol. 49, p. 103-111, 1978. 7 fig, 1 tab, 41 ref

Descriptors: *Polychlorinated biphenyls, *Phytoplankton, *Adsorption, Absorption, Toxicity, Photosynthesis, Growth rates, Inhibition, Aquatic populations, Biomass, Path of pollutants, Chemical wastes, Marine algae, *Freundlich adsorption isotherm

The time-courses of uptake for 2,4,5,2',5'-pentachlorobiphenyl (PCB) by 11 marine phytoplankton species were measured and found to be rapid, with equilibration occurring within 0.5 to 2.0 h. These data were described with the empirical Freundlich adsorption isotherm. The relationship between cell density and accumulation of PCBs was also investigated. Concentration factors on a volume per volume basis ranged from 1.23 x 10 to the 4th power to 2.41 x 10 to the 6th power for the 11 algal species examined. These values are comparable in magnitude to factors reported previously for phytoplankton in natural marine systems. (EIS-Deal)

POLYCHLORINATED BIPHENYLS: ACCUMULATION FROM CONTAMINATED SEDIMENTS AND WATER BY THE POLYCHAETE NEREIS DIVERSICOLOR.
International Lab. of Marine Radioactivity, Monte Carlo (Monaco). Oceanographic Museum
S. W. Fowler
Marine Biology, Vol 48, p 303-309, 1978. 4 fig, 20 ref

Descriptors: *Polychlorinated biphenyls, *Absorption, Sediments, Worms, Water chemistry, Animal metabolism, Animal physiology, Chemical analysis, Gas chromatography, Path of pollutants, Chemical wastes, Benthic fauna, *Tissue analysis, *Bioaccumulation, *Polychaetes, *Nereis, Depuration

Comparisons were made of the accumulation of a PCB mixture from sediments and from water by the benthic worm Nereis diversicolor. Uptake from sediments was dose-dependent, attaining equilibrium concentration factors of approximately 3 to 4 after 2 months. Subsequent PCB elimination rates were concentration-dependent, with higher initial loss rates evident in the worms containing higher levels of PCBs. Accumulation of PCBs from water was much more rapid; concentration factors reached approximately 800 after only 2 weeks. Estimates were made of the relative importance of sediments and water as a source of PCBs to worms exposed to these contaminants in the natural environment. Calculations based on experimentally derived PCB concentration factors and ambient PCB levels in sediments and water suggest that compared to water, sediments contribute the bulk of these compounds to the worms. The possible mechanisms involved in the uptake of sediment-associated PCBs are discussed. (EIS-Deal)

EFFECTS OF SEDIMENTS ON THE DEVELOPMENT OF MACROCYSTIS PYRIFERA GAMETOPHYTES.
University of Southern California, Los Angeles. Environmental Engineering Program
J. S. Devinny, and L. A. Volse
Marine Biology, Vol. 48, p. 343-348, 1978. 2 fig, 17 ref

Descriptors: *Sediments, *Growth stages, *Kelps, *Spores, Reproduction, Plant growth, Plant physiology, Benthic flora, Turbidity, Dredging, Sewage effluents, Sediment discharge, Mortality, Sedimentation rates, *Macrocystis

Rocky ocean bottoms are covered from time to time with small amounts of fine sediments. This material may interfere with the development of germling stage of Macrocystis pyrifera. Tests were performed by introducing sediments before and after spores were dispersed in culture dishes. 10 mg cm-2 of sediment, enough to occlude the surface, prevents spore attachment, greatly reducing the probability of survival. Smothering of established germlings was severe at 108 mg sediment cm-2. Water motion further reduced spore success where sediments were present, probably because of abrasive scour. Mechanisms of natural and human interference with M. pyrifera reproduction are suggested. (EIS-Deal)

Descriptors: *Eutrophication, *Phytoplank *Algicides, *Algal control, Reservoir operat Reservoirs, Water supply, Nutrients, Chem analysis, Water quality, Water treatment, Cya phyta, Filtration, Chlorination, Mollusks, Daph Photosynthesis, Monuron, Biocontrol, *Diuron

In some polluted waters, with nutrient enrichm and slightly increased temperature, favorable ditions are created for massive developmen algae. The enhanced growth of phytoplankton ates a considerable nuisance in water supp since it often disturbs treatment processes and pairs the quality of water produced. Biolog mechanical, physical and chemical methods of trolling algal blooms are compared. No method is best and there should be several methods for specific purposes for each water b (See also W79-03906) (EIS-Deal)

DETERMINING THRESHOLD AND BIOLOGICALLY DANGEROUS CONCENTRATIONS OF BLUE-GREEN ALGAE IN WATER BODIES,
Akademiya Nauk URSR, Kiev. Inst. Hidrobiologii.
L. A. Sirenko, A. Ya. Malyarevskaya, and T. I. Birger.
In: Proceedings of the First and Second USA-USSR Symposia on the Effects of Pollutants Upon Aquatic Ecosystems - Vol. 1, Environmental Protection Agency, Report EPA-600/3-78-076, p 105-114, 1978. 4 tab, 8 ref.

Descriptors: *Cyanophyta, *Toxicity, *Fish physiology, Eutrophication, Growth rates, Photosynthesis, Algal toxins, Water chemistry, Nutrients, Metabolism, Animal metabolism, Mortality, Vitamins, Animal pathology, Amino acids, Biochemistry, Zooplankton, Algae, *Tissue analysis.

It is important to remember that biologically dangerous concentrations of blue-green algae may change, depending on the effect of the algae's natural metabolites and synergism or antagonism with other biotic or abiotic water substances. In particular, the toxicity of blue-green algae will depend both on a series of chemical indices (temperature effect, content of oxygen in water, carbon dioxide, the presence of salts of such metals as manganese, zinc and lithium) and on the physiological state of algae cells (living, dead, decomposing). Thus, in our experiments, decomposing algae proved to be more toxic for fish. (See also W79-03906)(EIS-Deal)

THE IMPORTANCE OF TROPHIC BONDS IN THE BACTERIAL DESTRUCTION OF ORGANIC MATTER,
Akademiya Nauk SSSR, Moscow. Inst. Biologii Vnutrennykh Vod.
P. P. Umorin.
In: Proceedings of the First and Second USA-USSR Symposia on the Effects of Pollutants Upon Aquatic Ecosystems - Vol. 1, Environmental Protection Agency, Report EPA-600/3-78-076, p. 132-151, 1978. 11 fig, 2 tab, 18 ref.

Descriptors: *Protozoa, *Bacteria, *Organic matter, Water purification, Mathematical models, Growth rates, Model studies, Nutrients, Nitrogen, Biomass, Phenols, Trophic level, Predations, Cycling nutrients, Food chain, Waste assimilative capacity.

The interrelations of bacteria and protozoa in the rate of decomposition of organic matter is studied. Bacteria are the main consumer of organic matter in water bodies. Zooflagellates cannot affect the rate of decomposition of dissolved organic matter. As for infusoria, they can notably slow down the decomposition or organic matter by bacteria by means of reducing their number due to predation. However, in water bodies, as a rule, a deficiency in nutrients has been observed. Guaranteeing their recycling, infusoria may accelerate the bacterial destruction of organic matter. SIMULATION OF POTENTIAL POLLUTANT-CAUSED CHANGES IN THE ECOSYSTEM, RESULTING FROM THE SENSITIVITY OF AQUATIC ORGANISMS TO TOXICANTS,
Moscow State Univ. (USSR). Faculty of Biology.
N. S. Stroganov.
In: Proceedings of the First and Second USA-USSR Symposia on the Effects of Pollutants Upon Aquatic Ecosystems - Vol 1, Environmental Protection Agency, Report EPA-600/3-78-076, p 152-160, 1978. 2 fig., 1 tab.

Descriptors: *Simulation analysis, *Toxicity, Bioassay, Chemical properties, Growth rates, Laboratory tests, Ecosystems, Aquatic environment, Resistance, Daphnia, Bacteria, Algae, Chlorella, Scenedesmus, Anabaena, Mollusks, Worms, Diptera, Water Pollution effects, Path of pollutants, *Salicylanilide.

It is possible to simulate a complex ecosystem using a small volume, in which there are all of the basic cmponents characteristic of natural aquatic communities. However, such a simulation is expensive, very time-consuming, ad requires the equipping of a large experimental base. Another means of simulations could be based on laboratory tests and conducted according to a definite plan using representative organisms from basic functional groups which take part in the cycling of materials and of organisms which are of interest to industry. A representative experiment examining th toxicity of salicylanilide is presented. (See also V79-03906) (EIS-Deal)

FISH-POPULATION STUDIES IN THE OHIO RIVER,
W. C. Klein.
In: Proceedings of the First and Second USA-USSR Symposia on the Effects of Pollutants Upon Aquatic Ecosystems - Vol 1, Environmental Protection Agency, Report EPA-600/3-78-076, p 161-165, 1978. 5 ref.

Descriptors: *Fish populations, *Ohio River, Fish establishment, Commercial fishing, Sport fishing, Channel improvement, Locks, Fish barriers, Water pollution effects, Canal construction, Carp, Municipal wastes, Industrial wastes, Flow control, Flow rates, Reservoirs, Canals, *Species diversity.

A review of historical and recent information concerning fish in the Ohio River during 1957-60 and 1968-70 indicates that the composition of the fish population has changed during the period. In large measure, the changes can be attributed to the canalization of the river and increased pollution load. Although the pollution load has been decreased in recent years by the installation and operation of wastewater control facilities, the lake-like setting of the Ohio River continues to influence the kinds and numbers of fish in the river, as evidenced by the chemical fishing studies performed in the lock chambers. Although many of the so-called sport and commercial speicies have returned to the river, the fish species desiring a lake-like setting continue to dominate the populations. In: Proceedings of the First and Second USA-USSR Symposia on the Effects of Pollutants Upon Aquatic Ecosystems - Vol 1, Environmental Protection Agency, Report EPA-600/3-78-076, p 181-192, 1978. 3 fig, 1 tab, 2 ref.

Descriptors: *Phenols, *Toxicity, Bacteria, Resistance, Chlorophyta, Chlorella, Diptera, Daphnia, Organic Compounds, Chemical reactions, Fertility, Fish reproduction, Fish behavior, Trout, Growth stages, Fish physiology, Model studies, Microbial degradation.

In the first part of the investigation, some particular and general problems of aquatic toxicity have been studied on a model of phenol intoxication of aquatic organisms. Among the problems investigated were comparative resistance of aquatic organisms, the role of biotic and abiotic factors in determining, resistance effects of different concentrations of the toxicant on biological and physiological processes of auatic organisms, and ability of organisms to adapt. In the second part of the investigations, destruction of phenol in different model ecosystems has been studied. (See also W79-03906) (EIS-Deal)

HISTORY OF CHANGES IN FISH SPECIES OF THE GREAT LAKES,
J. F. Carr.
In: Proceedings of the First and Second USA-USSR Symposia on the Effects of Pollutants Upon Aquatic Ecosystems - Vol. 1, Environmental Protection Agency, Report EPA-600/3-78-076, p. 193-218, 1978. 3 fig., 9 tab., 27 ref.

Descriptors: *Great Lakes, *Fish populations, Lake Erie, Lake Huron, Lake Superior, Lake Michigan, Lake Ontario, Industrial wastes, Chemical wastes, Municipal wastes, Productivity, Trophic level, Nutrients, Spawning, Biological communities, Lampreys, Salmonids, DDT, Pesticide residues, Phytoplankton, Zooplankton, Water quality, Water quality control, *Species diversity, *Tissue analysis.

The purpose of this paper was to discuss the changes which have taken place in the fish populations of the Great Lakes and the stresses which have caused these changes. The stresses which have been placed on the fish communities of the Great Lakes have been sequential and reflect and progress of man's occupation of the basin and his technological development. Physical, biological, chemical and thermal alterations, including exploitation, destruction of spawning grounds, oxygen depletion, increased water temperature, change in available food, and competition with introduced species, are discussed. COLLAGEN AND HYDROXYPROLINE IN TOXICOLOGICAL STUDIES WITH FISHES,
F. L. Mayer, and P. M. Mehrle
In: Proceedings of the First and Second USA-USSR Symposia on the Effects of Pollutants Upon Aquatic Ecosystems - Vol. II, Environmental Protection Agency, Report EPA-600/3-78-076, p. 92-101, 1978. 1 fig, 4 tab, 26 ref.

Descriptors: *Fish physiology, *Biochemistry, *Protein, *Enzymes, Water pollution effects, Animal pathology, Chlorinated hydrocarbon pesticides, Insecticides, Toxaphene, *Collagen, *Hydroxyproline, Toxicity, Toxicological studies, Growth, Bone development, Backbone development, *Collagen formation, Vitamin C

Biochemical characteristics such as hydroxyproline ad collagen concentrations in bone can be used as indicators, and within limits, predicors of growth in fish thereby shortening chronic toxicity tests. Although growth can be directly related to collagen and hydroxyproline metabolism in fish, the mechanism by which growth is reduced is not known. Other biochemical processes requiring vitamin C could also be affected when large amounts of the vitamin are used by the liver in detoxication of organic contaminants through microsomal hydroxylative enzmes. Descriptors: *Hydrogen sulfide, *Toxicity, Mortality, Bioassay, Fresh water fish, Laboratory test, *Toxic concentrations, Chronic effects, Brook trout, Bluegill sunfish, Fathead minnow, Goldfish, Threshold toxicity, Growth aquiculture, LC50

Comparison of LC50 levels of hydrogen sulfide with those which have adverse effects after long exposure indicates that the 96-hr LC50 may be 3 to 8 times higher than the safe levels. The present work, and that of Smith and Oseid (1974), who examined the effect of hydrogen sulfide on early life history stages of 8 species of freshwater fish, slow that a safe level of hydrogen sulfide which will insure survival and growth of a fish population, and adequate survival of all life history stages will generally be between 0.002 and 0.004 mg/1 at 20 degree C. In bluegills, the level is significantly lower, and this pattern may be followed in other species not rested. (See also W79-03906) (EIS-Katz)

ENVIRONMENTAL EFFECTS OF OIL SHALE MINING AND PROCESSING, PART I: FISHES OF PICEANCE CREEK, COLORADO, PRIOR TO OIL SHALE PROCESSING,
Colorado Div. of Wildlife, Fort Collins. Fisheries Research Center.
J. P. Goettl, and J. W. Edde.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 87[illegible] Price codes: A03 in paper copy, A01 in microfiche. Report No. EPA-600/3-78-096, October 1978. 2[illegible] p, 1 fig, 1 tab, 29 ref. R803950.

Descriptors: *Fishes, *Fish populations, *Piceance Creek(Colorado), *Oil shales, Water pollution, Environmental effects, Fish migration, Fish reproduction, Surveys, Freshwater fish, Brook trout, Bullheads, Brown trout, Sampling

A survey was made of the fish populations of Piceance Creek, Colorado, to establish existing conditions prior to anticipated extensive oil shale processing in the area. Thirteen species of fish have been reported to occur in Piceance Creek; eight of them were recovered in this sampling. The mountain sucker and the speckled dace were the most numerous and widespread. Salmonids were most abundant at the three upper sampling stations of the creek, and brook trout were found in both tributaries. Population estimates of the mountain sucker were 61 and 36 fishes/100 m of stream at stations PC-2 and PC-3 during 1976. Survey results indicate that brook trout and brown trout are reproducing naturally in the creek, but rainbow trout are doing poorly. Species introduced from other drainages and the effects of creek alteration and agricultural diversions have produced changes in the fish fauna of this creek. Data reported in earlier research have been compared to data collected in this survey. Potential impacts of oil shale processing on the fish population of Piceance Creek are discussed. (See also W79-03975) (Dawson-IPA)
W79-03974

ENVIRONMENTAL EFFECTS OF OIL SHALE MINING AND PROCESSING, PART II: THE AQUATIC MACROINVERTEBRATES OF THE

PICEANCE BASIN, COLORADO, PRIOR TO OIL SHALE PROCESSING,
Colorado State Univ., Fort Collins. Dept. of Zoology; and Colorado State Univ., Fort Collins. Dept. of Entomology.
L. J. Gray, and J. V. Ward.

Descriptors: *Benthos, *Aquatic biota, *Streams, *Piceance Basin(Colorado), Environmental effects, Oil shales, Streamflow, Sampling, Biomass, Biota, Water pollution, Tributaries, Downstream, Upstream, Sediments, Aquatic life.

A study of the benthic macroinvertebrate communities on four streams in the Piceance Basin of north-western Colorado prior to oil shale mining and processing is reported. Environmental conditions varied longitudinally along the Piceance Creek, the major stream studied. The downstream direction showed greatly increased amount of total dissolved solids, sodium, sulfate and chloride. It also exhibited increases in temperature range, turbidity, severity of winter ice conditions, and effects of grazing and irrigation activities. Winter species of fauna inhabit the upstream areas of the creek, and its tributaries, while summer species inhabit the downstream regions. Of the 83 total macroinvertebrates collected only two were common at all sites indicating that these species are tolerant of a widely varying physical and chemical conditions which exist. The fauna of Black Sulphur Creek was generally similar to the middle Piceance sites, and Willow Creek fauna closely resembled Black Sulphur Creek fauna. A discussion of the impact of mining on this creek and its tributaries is general in nature, because the effects will depend on the types of extraction and processing to be used and the steps taken to protect the stream environment. EVALUATING THE SAMPLING FREQUENCIES OF WATER QUALITY MONITORING NETWORKS,
Colorado State Univ., Fort Collins. Dept. of Agriculture and Chemical Engineering.
R. C. Ward, and K. S. Nielsen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 367, Price codes: A03 in paper copy, A01 in microfiche. Final Report No. EPA-600/7-78-169, August 1978. 30 p, 1 fig, 4 tab, 10 ref, 1 append. CB-6-99-2530-A.

Descriptors: *Water sampling, *Water quality control, *Data collections, *Networks, *Sampling frequencies, Water analysis, Water quality, Monitoring, Design criteria, Water quality standards, Human population, Data storage and retrieval, STORET, Colorado, Minnesota.

A simple easy to use procedure for evaluating sampling frequencies in a routine fixed-station, water-quality monitoring network used for regulatory water-quality management purposes is presented. Evaluation of a regulatory water-quality monitoring system involves examining: sampling station locations, parameter coverage, and sampling frequencies. The procedure uses data currently in the Environmental Protection Agency's STORET inventory routine to compute the sample statistics, based on the assumption that each parameter follows the normal distribution: these sample statistics are then assumed to represent the 'population' parameters. The population parameters are used to examine the uniformity and size of the precisions about water quality mean. The evaluation procedure is demonstrated with data from the Colorado and Minnesota state water-quality management programs. It is recommended that future work in network design and data analysis be closely coordinated with the STORET system. (Davison-IPA)

DISTRIBUTION OF PHYTOPLANKTON IN ILLINOIS LAKES,
Nevada Univ., Las Vegas. Dept. of Biological Sciences.
M. K. Morris, L. R. Williams, W. D. Taylor, F. A. Hiatt, and S. C. Hern.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-285 411, Price codes: A07 in paper copy, A01 in microfiche. EPA-600/3-78-050, May 1978. 128 p, 3 tab, 11 ref, 1 append.

Descriptors: *Illinois, *Phytoplankton, *Trophic level, *Eutrophication, *Water quality indices, *Data collections, *National eutrophication survey, *Baseline studies, Bioindicators, Algae, Reservoirs, Distribution, Species diversity, Diversity indices, Species composition, Floral lists.

Phytoplankton species composition and abundance were determined for 31 Illinois lakes and reservoirs; in addition, the trophic status was assessed by means of several water quality indices, including Nygaard's five trophic state indices, Palmer's organic pollution indices, the Brillouin and Shannon/Weaver species diversity indices, and abundance indices. The study was conducted spring, summer, and fall 1973 as part of the National Eutrophication Survey. Lakes were selected on the basis of actual or potential accelerated eutrophication problems as measured by three criteria: (1) contamination by sewage treatment plant effluent, (2) surface area of at least 40 ha, and (3) hydraulic retention time of at least 30 days. Lakes surveyed: Bloomington, Carlyle, Charleston, Decatur, Lou Yaeger, Marie, Shelbyville, Springfield, Story, Sanfchris, Holiday, We-Ma-Tuk, and Vandalia; Coffeen, Crab Orchard, Long, Pistakee, Rend, Highland, Vermilion, Wonder, Depue, Fox, Grass, East Loon, Slocum, Cedar, Raccoon, Baldwin, and Horsehoe Lakes; and Old Ben Mine Reservoirs. Data are summarized by lake in an appendix containing alphabetical lists of phytoplankton species with concentrations of each by sampling date, and results of application of the indices. Nygaard's indices are based on algal groups known to be unique to eutrophic or oligotrophic waters. (Lynch-Wisconsin)
W79-03989

DISTRIBUTION OF PHYTOPLANKTON IN NORTH CAROLINA LAKES,
Nevada Univ., Las Vegas. Dept. of Biological Sciences.
M. K. Morris, L. R. Williams, W. D. Taylor, F. A. Hiatt, and S. C. Hern.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 387, Price codes: A05 in paper copy, A01 in microfiche. EPA-600/3-78-051, May 1978. 73 p, 3 tab, 11 ref.

Descriptors: *North Carolina, *Lakes, *Phytoplankton, *Trophic level, *Eutrophication, *Water quality indices, *Data collections, *National eutrophication survey, *Baseline studies, Bioindicators, Algae, Reservoirs, Distribution, Species diversity, Diversity indices, Species composition, Floral lists.

Phytoplankton species composition and abundance were determined for 16 North Carolina lakes and reservoirs; in addition, the trophic status was assessed by means of several water quality indices, including Nygaard's five trophic state indices, Palmer's organic pollution indices, the Brillouin and Shannon/Weaver species diversity indices, and abundance indices. The study was conducted spring, summer, and fall 1973 as part of the National Eutrophication Survey. Lakes were selected on the basis of actual or potential accelerated eutrophication problems as measured by three criteria: (1) contamination by sewage treatment plant effluent, (2) surface area of at least 40 ha, and (3) hydraulic retention time of at least 30 days. Lakes surveyed were Badin, Blewett Falls, Fontana, Hickory (Lake Oxford), High Rock, Hiwassee, James, Junaluska, Lookout Shoals, Mount Island, Norman, Rhodhiss, Santeelah, Tillery, Waterville and Waccamaw. Data are summarized by lake in an appendix containing alphabetical lists of phytoplankton species with concentrations of each by sampling date, and results of application of the indices. Nygaard's indices are based on algal groups known to be unique to eutrophic or oligotrophic waters. Palmer indices incorporate two lists of organic pollution-tolerant taxa, one with 20 genera, and one with 20 species. (Lynch-Wisconsin)

DISTRIBUTION OF PHYTOPLANKTON IN INDIANA LAKES,
Nevada Univ., Las Vegas. Dept. of Biological Sciences.
F. A. Morris, M. K. Morris, L. R. Williams, W. D. Taylor, and F. A. Hiatt.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 352, Price codes: A05 in paper copy, A01 in microfiche. EPA-600/3-78-078, August 1978. 70 p, 3 tab, 11 ref, 1 append.

Descriptors: *Indiana, *Lakes, *Phytoplankton, *Trophic level, *Eutrophication, *Water quality indices, *Data collections, *National eutrophication survey, *Baseline studies, Bioindicators, Algae, Reservoirs, Distribution, Species diversity, Diversity indices, Species composition, Floral lists.

Phytoplankton species composition and abundance were determined for 27 Indiana lakes and reservoirs; in addition, the trophic status was assessed by means of several water quality indices, including Nygaard's five trophic state indices, Palmer's organic pollution indices, the Brillouin and Shannon/Weaver species diversity indices, and abundance indices. The study was conducted spring, summer, and fall 1973 as part of the National Eutrophication Survey. Lakes were selected on the basis of actual or potential accelerated eutrophication problems as measured by three criteria: (1) contamination by sewage treatment plant effluent, (2) surface area of at least 40 ha, and (3) hydraulic retention time of at least 30 days. Lakes surveyed: Cataract, James, Wawasee, Webster, Whitewater, Winona, Westler, Witmer, Tippecanoe, Dallas, Olin, Oliver, Sylvan, Hovey, Versailles, Bass, Crooked, Long, Pigeon, Marsh, Hamilton, Maxinkuckee and James; and Geist, Mississinewa, Monroe, and Morse Reservoirs. Data are summarized by lake in an appendix containing alphabetical lists of phytoplankton species with concentrations of each by sampling date, and results of application of the indices. Nygaard's indices are based on algal groups known to be unique to eutrophic or oligotrophic waters. Palmer indices incorporate two lists of organic pollution-tolerant taxa, one with 20 genera, and one with 20 species. (Lynch-Wisconsin)
W79-03991

INORGANIC SPECIES IN WATER: ECOLOGICAL SIGNIFICANCE AND ANALYTICAL NEEDS, A LITERATURE REVIEW,
Environmental Research Lab., Athens, GA.
T. B. Hoover.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 945, Price codes: A06 in paper copy, A01 in microfiche. EPA-600/3-78-064, July 1978. 99 p, 2 fig, 518 ref.

Descriptors: *Reviews, *Bibliographies, *Inorganic compounds, *Pollutants, *Toxicity, *Water pollution effects, Chemicals, Heavy metals, Arsenic, Chromium, Lead, Mercury, Selenium, Absorption, Aquatic plants, Aquatic animals, Public health, Algae, Fish, Sublethal effects, Path of pollutants, Bioaccumulation, Analytical techniques, Water bodies, Speciation, Rivers, Lakes, Oceans, Estuaries, Impounds.

A literature review of environmental significance of inorganic chemical species (as opposed to total element content) in water emphasizes effects on human health and on plant and animal life. The bibliography lists 518 works, giving special attention to recent U.S. Government reports and conference proceedings. The role of valence state, ionization, complexation, and absorption in the transport and cycling of elements are considered, together with factors affecting distribution of elements and species in freshwater streams and impoundments, and in estuaries and the sea. Information on chronic effects on human health of trace inorganic pollutants is almost entirely limited to total elements because of lack of an adequate methodology to distinguish among forms of an element. Of greatest concern with respect to toxicity of

different species are arsenic, chromium, lead, mercury, and selenium. In the toxicology of aquatic biota, there is a growing appreciation that both acute and chronic effects are strongly related to chemical species. Movement of inorganic species in the aquatic environment is strongly influenced by absorption on both mineral and organic particulates. Absorption is highly dependent on the chemical species of the pollutant. (Lynch-Wisconsin)

POLYCHLORINATED BIPHENYLS IN PRECIPITATION IN THE LAKE MICHIGAN BASIN,
DePaul Univ., Chicago, IL.
T. J. Murphy, and C. P. Rzeszutko.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 363, Price codes: A03 in paper copy, A01 in microfiche. EPA-600/3-78-071, July 1978. 32 p, 4 fig, 5 tab, 46 ref, 1 append. 803 915.

Descriptors: *Lake Michigan, *Polychlorinated biphenyls, *Precipitation, *Rainfall, *Fallout, *Air pollution effects, *Water pollution sources, Lake Michigan Basin, Great Lakes, Lakes, Chicago(IL), Illinois, Beaver Island(MI), Michigan, Poisons, Pollutants, Landfills, Snow, Arochlor, Dry fallout, Particulates, Gases, Industrial wastes.

Analysis of rainfall samples from Chicago, Illinois (1975-77) and Beaver Island, Michigan (1976) for polychlorinated bphenyls (PCBs) showed precipitation as the major known source of PCBs to Lake Michigan. Since concentrations in samples from the two sites were about equal, it is concluded that PCBs are widely distributed by the atmosphere. Significant concentrations were also found in two other areas some distance from urban and industrial centers, indicating that sources of PCBs to the atmosphere are diffuse and residence times are long; PCB concentrations in snow samples from Mammoth Cave, Kentucky were similar to those of Chicago. Volume weight mean concentration from 35 rain samples from Chicago and Beaver Island was 111 ng/l of PCBs as Arochlor 1242 + 1254 + 1260, indicating a deposition rate of 4800 kg PCB/yr to Lake Michigan from precipitation. Comparison of air and precipitation samples showed most PCB present in the atmosphere as vapor, with the rest as particulate. This finding, together with the high solubility of PCBs in nonpolar organics, casts doubt on the validity of monitoring dry deposition of PCBs using collectors covered with nonpolar liquids such as mineral oil. Gas samples from a vented sanitary landfill had PCB concentrations in the microgram/cu m range, indicating landfills may be an important source of PCBs to the atmosphere. (Lynch-Wisconsin)

SIZE DEPENDENT MODEL OF HAZARDOUS SUBSTANCES IN AQUATIC FOOD CHAIN,
Manhattan Coll., Bronx, NY.
R. V. Thomann.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 009, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency, Duluth, Minn. Report EPA-600/3-78-036, April 1978. 40 p, 7 tab, 11 fig, 216 ref.

Descriptors: Methodology, *Polychlorinated biphenyl, *Lake Ontario, Great Lakes, Water pollution effects, Mathematical models, Lakes, *Coho salmon, Freshwater fish, Smelts, Sculpins, Water analysis, On-site-investigations, Alewife, *Food chains, Food habits, Organism size, Mathematical studies, Chlorinated hydrocarbon pesticides.

A model of toxic substance accumulation is constructed that introduces organism size as an additional independent variable. The model represents an ecological continuum through size dependency; classical compartment analyses are therefore a special case of the continuous model. Size dependence is viewed as a very approximate ordering of trophic position. The analysis of some PCB data in Lake Ontario is used as an illustration of the theory. A completely mixed water volume is used. Organism size is considered from 100 m to 10 to the sixth power m. PCB data were available for 64 m net hauls, alewife, smelt, sculpin and coho salmon. The analysis indicated that about 30% of the observed 6.5 g PCB/gm fish at the coho salmon size range is due to transfer from lower levels in the food chain and about 70% from direct water intake. The model shows rapid accumulation of PCB with organism size due principally to decreased excretion rates and decreased biomass at higher trophic levels. The analysis indicates that if a level of 5 g PCB/gm at 10 to the sixth power m is sought, total (dissolved and particulate) water concentration would have to be about 36 ng/l or about 66% of the present 55 ng/l. HUMAN POPULATION EXPOSURES TO MIREX AND KEPONE,
Stanford Research Inst., Menlo Park, CA. Center for Resource and Environmental Systems Studies.
B. E. Suta.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-285 430, Price codes: A07 in paper copy, A01 in microfiche. Environmental Protection Agency, Report EPA 600/1-78-045, June 1978. 139 p, 8 tab, 118 ref.

Descriptors: *Public health, *Insecticides, Pesticides, Water pollution, Path of pollutants, Poisons, Human diseases, *Food chain, Sport fish, Sport fishing, Water quality, Water sources, Water supply, Domestic water, *Mirex, *Kepone, *Human exposure, *Commercial fish.

Human exposures to mirex and kepone are assessed in this study. Three major paths of exposure are examined: ingestion through the food chain, inhalation of atmospheric mirex and kepone, and exposure through drinking water. Exposure through the food chain appears to be the most pressing current problem. Various species of commercially caught fish in certain areas of the country have been found to contain slight amounts of the compounds. It is difficult to obtain estimates of the human exposure from sport fish, but evidence seems to suggest that sportsmen and their families may be exposed through fish. Also, game captured in the southeastern U.S. has been found to contain the compounds. Kepone has been found in mothers' milk in some areas of the country. Atmospheric exposures are not considered terribly great now, since the compounds are no longer produced and the major atmospheric exposures are believed to be occupational exposure at the producing factory and exposure to workers' families from clothing, etc. Human exposure to mirex and kepone from drinking water supplies does not appear to be a problem, since both compounds are very insoluble in water. Exposure through tobacco was also considered. (EIS-Katz)

5D. Waste Treatment Processes

SIMULATION OF ADVANCED WASTEWATER TREATMENT SYSTEMS,
Waterloo Univ. (Ontario). Dept. of Civil Engineering.
P. T. Lam, G. J. Farquhar, and E. A. BcBean.
Water Pollution Research Canada, Vol 13, 1977/1978, p 97-120. 13 fig, 4 tab, 35 equ, 42 ref.

Descriptors: *Simulation analysis, *Waste water treatment, *Performance, *Computer models, *Projects, Lime, Ammonia, Filtration, Carbon, Adsorption, Chlorination, Fluctuations, Equations, Operations research, Regression relationship, Prediction, Recarbonation.

Simulation models for advanced wastewater treatment system component processes were identified or developed as necessary. They were used to simulate the performance of existing systems including lime treatment, ammonia stripping, recarbonation, filtration and carbon adsorption. Comparisons between predicted and measured effluent properties were reasonable. The component models were combined into an integrated model and used to simulate the operation of the Santee Project advanced wastewater treatment system. Simulations were again reasonable. It was concluded that the combined model could be used to provide realistic estimates of system efficiency response to variations in input parameters. (Bell-Cornell)

LEAST-COST DESIGN OF URBAN-DRAINAGE NETWORKS,
Washington Univ., Seattle. Dept. of Civil Engineering.
S. Froise, and S. J. Burges.
Journal of the Water Resources Planning and Management Division, Vol 104, No WR1, Proceedings of the American Society of Civil Engineers, p 79-92, November 1978. 8 fig, 1 tab, 12 equ, 22 ref.

Descriptors: *Urban drainage, *Design, *Storm sewers, *Storage, *Dynamic programming, *Cost minimization, Planning, Optimization, Hydraulics, Hydrology, Flow routing, Networks, Simulation analysis, Water flow, Hydrographs, Steady state, Mathematical models, Equations, Systems analysis.

This paper demonstrates the feasibility of applying dynamic programming (DP) to the least-cost design of drainage networks which include storage elements. Network layouts are assumed to be known from previous planning activities, hydrographs at network inlets have been taken as given and the approach is demonstrated for a hypothetical case. For the purpose of this work, urban drainage networks are defined as combinations of conveyance and storage elements. The optimization problem is cast as an N-stage sequential process; in DP terminology, network nodes or junctions are treated as the stage variable, conduit invert elevations at the junctions as the state variable, and maximum flow rates and conduit sizes as decision variables. Using DP and unsteady flow routing, the problem is solved by a stagewise double pass over the network. All feasible solutions and the state transformations are determined followed by a second pass over the same stages for purposes of routing the inflow hydrographs of the stage variable. In conclusion, the method converges to global optima, requires small amounts of data, and is associated with reasonable computation requirements. (Bell-Cornell)

POLLUTION ABATEMENT IN A COPPER WIRE MILL.

Environmental Protection Agency, Cincinnati, OH. Office of Technology Transfer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 455, Price codes: A02 in paper copy, A01 in microfiche. Report No. EPA/625/2-73/003, August 1973. 13 p, 6 fig, 2 tab.

Descriptors: *Waste water treatment, *Water pollution control, *Copper, Copper alloys, Industrial wastes, Chemical wastes, Effluents, Water quality control, Industrial water, Electrolysis, Comparative costs, Liquid wastes, Solid wastes, Water conservation.

A process for reducing water consumption in copper wire mills by 90% is described. The process consists of three basic steps: (1) regeneration and copper recovery system for the primary pickling; (2) chemical rinse; and (3) a secondary pickling using hydrogen peroxide and proprietary additives. High purity metallic copper was recovered from the regenerated sulfuric acid pickle through continuous electrolysis. Plant water consumption was reduced from 200,000 gallons per day to 20,000 gallons per day, and total solids leaving the plant were reduced from 2500 lbs per day to less than 100 lbs per day. Estimated annual savings of this pollution abatement program compared to a waste treatment only program were $163,000 or $2.61 per finished ton of wire, based on 6,000 hours of operation per year of a 62,500 ton capacity plant. Five installations manufacturing copper and copper alloy products are currently using this process. This chemical rinse technique is also applicable to electroplating operations. (Davison-IPA)

COLOR REMOVAL FROM KRAFT PULPING EFFLUENT BY LIME ADDITION.
Environmental Protection Agency, Cincinnati, OH. Office of Technology Transfer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 135, Price codes: A02 in paper copy, A01 in microfiche. Report No. EPA/625/2-73-002, April 1973. 13 p, 7 fig, 2 tab.

Descriptors: *Water pollution control, *Color, *Industrial wastes, *Waste water treatment, *Pulp wastes, Pulp and paper industry, Sedimentation, Lime, Neutralization, Separation techniques, Waste storage, Water purification, Pilot plants, Sludge.

The operation of a full scale process for lime decolorization of kraft pulping total mill effluent is discussed. Slaked lime was applied to the total mill effluent, and during primary sedimentation mixed fibrous and lime decolorization sludges were removed. The effluent was then stored in a basin where biochemical stabilization took place. Excessive lime alkalinity was neutralized in the basin by absorption of atmospheric carbon dioxide. A pilot-scale study of recarbonation for enhanced lime separation and more rapid effluent neutralization prior to biochemical stabilization to obtain preliminary design data is discussed. Potential savings of raw material by recovery of the lime used is estimated at $78,000 annually. (Davison-IPA)

A FEASIBILITY STUDY OF RESPONSE TECHNIQUES FOR DISCHARGES OF HAZARDOUS CHEMICALS THAT DISPERSE THROUGH THE WATER COLUMN,
Little (Arthur D.), Inc., Cambridge, MA.
E. Drake, D. Shooter, W. Lyman, and L. Davidson.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A040 968, Price codes: A12 in paper copy, A01 in microfiche. Final Report No. CG-D-16-77, July 1976. 254 p, 27 fig, 51 tab, 39 ref, 4 append. DOT-CG-51122-A.

Descriptors: *Water pollution treatment, *Spills, *Chemicals, *Hazards, Chemical wastes, Neutralization, Solvent extractions, Precipitation, Chelation, Water chemistry, Water properties, Water treatment, Waste treatment.

The feasibility of treating hazardous chemical spills which are soluble in water was investigated. Four different methods were examined in detail as response techniques for ameliorating these spills: neutralization, solvent extraction, precipitation, and chelation. For each technique, the principles are described, requirements for alleviating the ecological impact of the spill are presented, the rationale for the screening of potential agents is discussed, and the most appropriate agents are selected. The potential application methods of the preferred agents are described, and the environmental considerations of both the effects of the spilled chemical and the application of the agent are discussed. It is concluded that: neutralization seems feasible and practical for treating spilled chemicals which are acids and bases; sodium bicarbonate is recommended for acids, sodium dihydrogen phosphate for bases; solvent extraction is feasible but has practical limitations; vegetable oil is the most satisfactory solvent agent; chemicals ameliorated by precipitation contain cations and anions, so that a single agent is not effective for both types; chelation is limited in applicability to the same chemicals considered for precipitation. (Davison-IPA)

PHARMACEUTICAL INDUSTRY: HAZARDOUS WASTE GENERATION, TREATMENT, AND DISPOSAL.
Environmental Protection Agency, Washington, DC. Office of Solid Waste Management Programs.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 800, Price codes: A09 in paper copy, A01 in microfiche. Report No EPA/SW-508, 1976. 190 p, 19 fig, 62 tab, 69 ref, 2 append.

Descriptors: *Waste treatment, *Pharmaceutical industry, *Waste disposal, *Industrial wastes, Hazards, Fermentation, Incineration, Landfills, Organic wastes, Effluents, Biochemical oxygen demand, Costs, Cost analysis, Basic data collections, Surveys, Solid wastes, Water pollution control, Surveys.

Studies were made to provide the Environmental Protection Agency (EPA) with: (1) a data base concerning the current and projected types and amounts of industrial waste and applicable disposal methods and costs; (2) a data base for technical assistance activities; and (3) and a background for development work as required by the Solid Waste Disposal Act as amended. The basic objectives of this study were: (1) to determine the characterization of pharmaceutical industry wastes (1973), and to project these wastes to 1977 and 1983; (2) to define the current treatment and disposal practices within the industry; (3) to investigate improved control technologies potentially applicable in reducing the hazards of these wastes; and (4) to calculate costs for the implementation of three levels of control technology in a hypothetical or existing plant. Information concerning research and development, biological products, fermentation, organic synthetics, extraction of animal glands, and formulation and packaging operations was extrapolated from surveys conducted during site visits. Eight landfills and four contractors treating wastes by incineration were visited. It is expected that quantities of hazardous and nonhazardous wastes will increase proportionately with production with no significant effect of air and water guidelines for 1977 and 1983. About 5,600 metric tons of hazardous wastes and 150,000 metric tons ot total wastes are finally disposed of on land in secure chemical landfills or are encapsulated. Generalized costs of treatment are summarized, and costs for 'end-of-pipe' treatment and disposal of each hazardous waste are calculated. (Davison-IPA)

FLUORIDE REMOVAL AND RELEASE BY ALUMINUM SULFATE FLOC,
Auburn Univ., AL. Dept. of Civil Engineering.
J. B. Thomas, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 562, Price codes: A10 in paper copy, A01 in microfiche. M.S. Thesis, 1975. 89 p, 13 fig, 16 tab, 54 ref, append. OWRT A-043-ALA(2).

Descriptors: *Fluorides, *Alum coagulation, Sludge storage, *Water treatment, *Waste water treatment, Hydrogen ion concentration, *Coagulation, *Turbidity, Alkalinity, Fluoride content.

An experimental investigation was conducted to determine the amount of previously added fluoride removed during alum coagulation. The effects of time, turbidity, pH and amount of fluoride addition were examined and various methods for determining different forms of fluoride were investigated. Furthermore, the release of fluoride during sludge storage was studied. Turbid water samples of known turbidity, alkalinity and fluoride content were coagulated with alum by the standard jar test procedure, and analyzed for residual fluoride and aluminum content. Greatest fluoride removal occurred at pH 6.5 and carryover aluminum concentrations were found to corrspond directed to optimum alum doses. A method for measuring complexed and uncomplexed forms of fluoride was attempted. Sludge samples were placed in plastic bottles and stored in the laboratory. Supernatant from these bottles was collected at monthly intervals and over a five month period the fluoride content of the supernatant was found to change. Bottom samples were collected at various points along Wilmore Creek which receives sludge discharges from the Auburn Water Treatment Plant. The samples were found to decrease in fluoride content with increasing distance from the point of sludge discharge.

NOTE ON THE FERTILITY VALUE OF OXIDATION POND EFFLUENT FOR GROUNDNUT (ARACHIS HYPOGAEA L.),
Central Public Health Engineering Research Inst., Nagpur (India).
C. K. Kale.
Indian Journal of Agricultural Science, Vol. 43, No. 5, p 523-525, May, 1973. 2 tab, 4 ref.

Descriptors: *Legumes, *Phosphorus, Effluents, *Oxidation lagoons, Nutrients, *Sewage treatment, *Fertilizers, *Waste water treatment, Waste treatment, Water reuse, *Groundnut(Arachis hypogaea L), *India.

The value of domestic sewage as a fertilizer was tested at an oxidation pond, using groundnut as the test plant. Seven tratments were used, including a tap-water control. N,P, and K concentrations of the fertilizers are given. The effect of different treatments on root growth was significant at 5 percent level. Synthetic sewage and control gave similar results. The effect of irrigation treatments on the vegetative growth of the groundnut was significant at the 1 percent level. Although the addition of phosphorus to this effluent gave a

better yield, the increase over the effluent alone was not significant. It is believed that the shortage of phosphorus in comparison to nitrogen and pottassium in the raw sewage and effluent was compensated for by other nutrient elements, including microelements. (Carpenter-FIRL)

METHOD OF DISPOSING OF A FERROUS-ION CONTAINING ACIDIC AQUEOUS WASTE FOR FORMING POLYCRYSTALLINE IRON COMPOUND PARTICLES,
Nippon Electric Co. Ltd., Tokyo. (Assignee)
K. Iwase, T. Takada, and M. Kiyama.
U.S. Patent No. 4,119,536, 3 p, 10 ref, Official Gazette of the United States Patent Office, Vol 975, No 2, p 671, October 10, 1978.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Water pollution treatment, Separation techniques, Iron compounds, Chemical precipitation, Acidic water.

Acidic waste including ferrous or bivalent iron ions, for example, the waste lye of a pickle for articles made of iron and a waste that inevitably results during production of titanium white includes, besides the ferrous ions, either halogen or sulfate ions and is strongly acidic. On disposing of the acidic waste the ferrous ions are oxidized to produce iron compound precipitate in a remaining waste liquid. With the temperature of the waste kept between 50 degrees C and 75 degrees C and with pH of the waste liquid adjusted between 3.5 and 5.2, fine particles of the iron compound otherwise produced agglomerate into large polycrystalline particles. The large particles are readily separated from the waste liquid, which is now substantially neutral and transparent. (Sinha-OEIS)

TREATMENT OF WASTE LIQUID AND APPARATUS THEREFOR AND A FERTILIZER COMPOSITION OBTAINED THEREBY,
Nittetu Chemical Engineering Ltd., Tokyo (Japan). (Assignee)
T. Yamauchi, M. Akune, and S. Kouchi.
U.S. Patent No. 4,119,538, 6 p, 1 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 975, No 2, p 671, October 10, 1978.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, Organic wastes, Inorganic compounds, Incineration, Fertilizers, Concentration, Fermentation industry.

A process for treating a waste liquid which is obtained from a fermentation process, e.g., an alcohol fermentation, and contains organic and inorganic substances which are useful as fertilizer, is provided. The process includes combusting a concentrate of the waste liquid and bringing the combustion products containing the ashes which are formed from the inorganic substances and the hot combustion gases into direct contact with a fresh portion of the waste liquid. The liquid is concentrated by evaporation and a slurry of the ashes in the concentrated waste liquid is formed. The slurry is separated into a solid sediment containing the minerals and a part of the organic components of the liquid. By drying the sediment with agitation, a granulate which can be used as a fertilizer can be produced. (Sinha-OEIS)

COMBINED FILTER AND INCINERATOR,
Thiokol Corp., Newtown, PA. (Assignee).
D. P. Clark, and W. F. Wagner.
U.S. Patent No. 4,120,792, 4 p, 4 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 975, No 3, p 1102, October 17, 1978.

Descriptors: *Patents, *Waste water treatment, Water pollution treatment, Water pollution control, *Filtration, *Incineration, *Filters, Solid wastes, Ships.

An enclosure having an inlet and an outlet for hot air, and an inlet and an outlet for waste water, contains a number of refractory, porous, tubular, membrane-type filters, each of which is closed at one end and connected at its other end to the waste water outlet. Hence, waste water entering through its inlet in the enclosure must pass through the walls of the filter tubes before being discharged through its outlet. During this process, any solid particles in the water become deposited on the outer surfaces of the filter tubes. After a filtering cycle is over and the waste water has been drained through its outlet, a heating means, equipped with a blower and attached to the hot-air inlet, forces heated air into the enclosure to incinerate the solids deposited on the filter tubes. Therefore, the filter tubes serve also as refractory grates to hold the sludge while it burns. After the sludge has been burned, an automatic timer switches back to the filtering cycle. (Sinha-OEIS)

Laboratory and outdoor (raceway) experiments in Belgium demonstrated the feasibility of tertiary treatment of swine manure by mass culturing of three species of chlorophyte algae. Laboratory assays with the algae (Scenedesmus acutus var. alternans, Chlorella vulgaris, and Coelastrum proboscideum) showed that both diluted and undiluted aerated swine manure constitute excellent substrates for the algae, yielding several grams dry algae per liter of waste. Addition of carbon dioxide to the cultures for pH stabilization resulted in much better algal growth. In the outdoor raceways (with paddles) satisfactory algal growth was achieved with diluted waste, except during winter when temperatures are too low and day length too short. During spring and summer yields of over 10 g/sq m/day were obtained. Nitrogen and phospghorus were generally reduced more than 90%. Addition of carbon dioxide had little or no effect on nutrient elimination. With control of nutrient input based on calculation of the theoretical yield under prevailing light conditions, good results can be obtained, and the algal biomass may be harvestible as a cheap food protein source. Stock cultures were maintained at high concentrations on solid (agar) and liquid media, and batch cultures for inoculation to the raceways were preadapted to swine manure by addition of 5% swine effluent to the artificial medium. Manure was subjected to secondary treatment before the experiments. (See also W79-03842) (Lynch-Wisconsin)

Microorganism, Municipal wastes, Analytical methods, Methodology, Gas chromotography, Biomass, *Carboxymethyl tartronate.

Carboxymethyl tartronate (CMT) was shown to be biodegradable in bench-scale activated sludge reactors. After initial exposure to CMT in continuous flow systems an acclimation period of 14 weeks was necessary before efficient degradation occurred. Once acclimated to CMT the biomass could be starved in regard to this substrate for at least 1.6 times the sludge age and still retain capacity to degrade the material upon re-introduction. Activated carbon was not found to be effective for CMT removal at a pH value of 7. (EIS-Katz)

5E. Ultimate Disposal Of Wastes

UTILIZING SOLID WASTES FOR BUILDING MATERIALS,
Municipal Environmental Research Lab., Cincinnati, OH.
R. E. Landreth.
News of Environmental Research in Cincinnati, January 25, 1977. 4 p, 2 fig, 2 ref.

Descriptors: *Ultimate disposal, *Waste treatment, *Recycling, *Construction materials, Wastes, Phenols, Fly ash, Industrial wastes, Plastics, Wood wastes, Solid wastes.

Research on the application of solid waste materials which could be integrated into standard composite products for the building industry is reported. Successful utilization of waste materials for this purpose includes: (1) an assessment of the type, location and volume; (2) development of the material into a composite product, (3) development of the product into standard building components; (4) economic evaluation; and (5) a utility demonstration as full scale units. Laboratory studies indicated that furfurals, inorganics, and phenols were the best materials to be used as binding agents or matricies. Materials useful as reinforcement were also useful as filler materials; wood bark, waste plastic rice hulls, peanut shells and fly ash were selected for composite development. Various combinations of waste materials and methods produced a product comparable to commercially available particle board, a potential replacement for sheet rock, fire doors, and fire rated partition walls. The inorganic composites would not burn, and produced no smoke, which eliminates some fire hazards. It is concluded that building products developed from waste materials are structurally sound, aesthetically pleasing and can be produced at 50 to 70% of the costs of standard building materials. (Davison-IPA)

BIOGAS RECOVERY FROM SOLID WASTES,
Municipal Environmental Research Lab., Cincinnati, OH.
C. A. Clemons.
News of Environmental Research in Cincinnati, September 15, 1976. 4 p, 1 fig, 10 ref.

Descriptors: *Waste disposal, *Biogasification, *Ultimate disposal, *Anaerobic digestion, Sludge digestion, Methane, Animal wastes, Landfills, Farm wastes, Municipal wastes, Sewage sludge, Sludge treatment, Economic feasibility, Solid wastes.

A summary of research and current activities relating to biogasification of solid wastes is presented. Anaerobic digestion of cattle wastes has been studied as to feed quality of the sludge and economic feasibility by the Northern Regional Research Center of the Department of Agriculture in Illinois. Further study involving the building of a digester in Nebraska is expected to establish the nutritional value of these residues. A number of universities are involved in research on animal wastes from cattle, swine, horses and poultry, and have built digesters to process these wastes. Research is being sponsored by the Energy Research and Development Administration on biogasification at Stanford, Cornell, the University of California at Berkeley, and the University of Illinois. Companies financing the construction of large-scale digesters to produce pipe-line quality methane include: ERA Incorporated of Lubbock, Texas, and Calorific Recovery Anaerobic Process Incorporated of Oklahoma City. Operational parameters of the process as applied to urban trash have been defined and a computer analysis of the economics of the process has been prepared. Biogas produced from sewage sludge is of poor quality and low quantity because the toxic materials present in human sewage sludge destroy or inhibit anaerobic digestion. Land fills are a comparatively small source of biogas. Methane has been recovered from the Los Angeles County, Palos Verdes landfill by Reserve Synthetic Fuels which has plans to develop other methane recovery sites in California, Arizona, Illinois, New Jersey, New York, and Pennsylvania. SURVEY OF BENTHIC CORAL REEF ECOSYSTEMS, FISH POPULATIONS, AND MICROMOLLUSKS IN THE VICINITY OF THE WAI'ANAE SEWAGE OCEAN OUTFALL, O'AHU, HAWAII -- SUMMER 1975,
Hawaii Univ., Honolulu. Water Resources Center.
S. A. Reed, E. Kay, and R. Russo.
Technical Report No. 104, May 1977. 34 p, 10 fig, 4 tab, 14 ref, 2 append.

Descriptors: *Benthic ecosystems, Fish populations, *Coral reefs, *Hawaii, Outfalls, Waste disposal, Sewage disposal, *Mollusks, *Diversity indices, *Similarity indices, *Sewage ocean outfall, Marine survey.

A marine survey was conducted in the vicinity of the present and proposed Wai'anae sewage ocean outfall site on the southwest coast of O'ahu, Hawaii. The survey at depths of 6 to 30 m (20-100 ft) characterized quantitatively the coral reef community, the reef fish population, and micro-molluscan assemblages. Diversity indices were calculated for substrate, fish, and micromollusks. Similarity indices were computed and a dendrograph was generated for all stations. The stations could be clustered into three distinct regions: (1) a deep-water region (18-30 m depth) with smooth hard algae-covered limestone substrate and sand, low fish abundance and diversity, low micromollusk diversity with high abundance of dialids, and low abundance of archeogastropods and rissoids; (2) a shallow-water region (6-18 m depth) with comparatively high coral cover, high fish abundance and diversity, high micromollusk diversity with low abundance of dialids and high abundance of rissoids and archeogastropods; and (3) the region along the harbor channel at POHA'I Bay where coral cover, fish abundance and diversity, and micromolluscan species abundance were distinctly different from those of other stations, indicating a probable influence by the boat harbor and channel on the benthic community. The sewage effluent has not adversely influenced coral growth in the vicinity of the outfall diffuser, although increased nutrients may account for high abundance of frondose algae at this station.

Descriptors: *Reviews, *Pesticide removal, *Waste treatment, *Waste disposal, Incineration, Pesticide treatment, Degredation, Chemical wastes, Landfills, Anaerobic digestion, Ultimate disposal, Chemical reactions, Cost analysis, Environmental effects, Reviews.

A review of published and unpublished information on recent and continuing research and development on waste or excess pesticide disposal and conversion methods is presented. The methods were categorized according to four approaches: high temperature incineration; physical/chemical treatment; biological methods; and land disposal. Potential economic costs and environmental impacts, problems of field disposal of finished pesticide formulations, and present and potential future 'problem' pesticides are also examined. It was concluded that for all methods examined, that more study would be required because potential environmental and economic impacts had not been adequately or completely defined. Of the 55 problematic pesticides, considered as potential or future waste problems, 23 have been researched for potential disposal methods which can be made environmentally acceptable. (Davison-IPA)

IMPROVED WATER SOFTENING PROCESS,
J. D. Sheppard, and D. G. Thomas.
Available from the National Technical Information Service, Springfield, VA 22161 as PAT APPL-533 048, Price codes: A02 in paper copy, A01 in microfiche. Patent Application, Serial No. 533, 048, February 25, 1975. 9 p, 1 fig, 1 tab.

Descriptors: *Water treatment, *Water softening, Demineralization, Filtration, Membrane processes, Quality control, Separation techniques, Hardness(Water), Calcium compounds, Magnesium compounds, Lime-soda process.

An innovative process of softening water hardness caused by CaCO3 and Mg(OH)2 is discussed. A modified form of the lime-soda process is employed coupled with cross-flow filtration. A principal feed source of this process is derived from the lime-soda process whereby large-scale hardness is removed through the addition of slaked lime in large tanks; the precipitated hardness allowed to settle. The resulting slurry serves as feed for the cross-flow filtration. This involves pumping feed through a porous pipe on which is deposited a thin permeable layer of finer porosity than the pipe. The feed water passes across the deposited layer and across the tube wall, and is collected as a filtered product. Feed hardness as high as 5000 ppm has been processed by this method. (Davison-IPA)

SIMPLE, EFFECTIVE METHOD FOR PURIFYING THE AS-1 CYANOPHAGE,
California Univ., Riverside, Dept. of Plant Pathology
M. B. Barkley, and P. R. Desjardins.
Applied and Environmental Microbiology, Vol. 33, No. 4, p 971-974, April 1977. 3 fig, 5 ref. OWRT B-176-CAL(2).

Descriptors: *Viruses, *Water purification, *Microbiology, Laboratory tests, Dialysis, Centrifugation, Bentonite, Aeration, Evaporation, Microorganisms, Water pollution sources, Toxicity, Infection.

A new method for purifying the AS-1 cyanophage virus involves treating virus-induced culture lysates with unfractionated bentonite, dialysis against 0.01M tris (hydroxymethyl) aminomethane-hydrochloride buffer, rotary evaporation concentration, and centrifuging through linear sucrose gradient columns. Small amounts (100 ml) of lysate are required to obtain relatively high yields of highly infectious virus. Bentonite clarification along with density gradient centrifugation could be used for the purification of other cyanophages. (Davison-IPA)

Descriptors: Water treatment, Potable water, *Chloroform, Water quality, Damage function, *Treatment costs, Cost-benefit analysis, *Economic analysis, Cost analysis, *Alternative costs.

Recent research has demonstrated that organic contaminants of potential health significance are ubiquitous in America's drinking water. Among these many compounds, chloroform is rapidly becoming an object of state and federal regulatory interest because several scientific studies have found a link between cancer death rates and concentration levels of chlorogorm in drinking water. The purpose of this study is to provide an assessment of the scientific and technical information needed to conduct a benefit-cost analysis of removing chloroform from drinking water. The analysis focuses on the derivation of a benefit function from the removal of chloroform in finished drinking water, and then compares the derived benefits with costs associated with control methods. This study also provides a systematic framework for coordinating diverse data and a method of analyzing the way that different assumptions would affect the alternatives liklely to be considered by the regulatory agency.

EVALUATION OF A PROTOTYPE AUTOMATED POND WATER TREATMENT UNIT,
Oklahoma State Univ., Stillwater. Dept. of Agricultural Engineering.
C. E. Rice, J. E. Garton, and M. L. Magnuson
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 750, Price codes: A02 in paper copy, A01 in microfiche. Water Resources Research Inst. Oklahoma State Univ. Research Project Tech Completion Rept 1978. 17 p, 2 fig, 4 tab, 2 ref. OWRT-A-066-OKLA(1).

Descriptors: *Water treatment, *Ponds, *Filtration, *Filters, *Turbidity, Alum treatment, Performance, Maintenance, Operations, Rural water supply, Upflow filter.

Two automatic pond water filtration units were tested with performance evaluated by analysis of both raw and treated water samples. A large filter, three feet in diameter, was tested and provided water at just over two gpm per square foot. The small filter, with an area of one square foot, was tested at various flow rates, run lengths, and total operating times. Both units were upflow filters with flocculation taking place below the filter media. The units effectively reduced turbidity as indicated by analysis of raw and purified water. High turbidity waters could not be effectively treated, and high flow rates gave unsatisfactory results. The filters had to be operated at or close to the design flow of one gpm per square foot. Correct alum dosage were important to insure a functional filter system. Maintenance of the system required periodic refilling of chemical solution tanks, backwashing of the filter, and replacement of filter media. These operations could easily be done in conjunction with a time clock regulation of the system.

U.S. Patent No. 4,119,520, 9 p, 4 fig, 3 ref. Official Gazette of the United States Patent Office, Vol. 975, no 2, p 666, October 10, 1978.

Descriptors: *Patents, *Water purification, Water quality control, *Electrolysis, Filtration, *Oxidation, Electrodes, *Anodic oxidation

A water system capable of purifying raw water by anodic oxidation is described. The system include

an electrolytic cell adapted to hold a body of water to be purified. Two electrodes are mounted in the cell and electrically insulated from each other. The cell is fastened to a pump, to a power supply, and to a control device. The pump supplies the water to the cell and discharges purified water from the cell in a predetermined path. The power supply supplies electrolyzing current to the electrodes in the cell. The control device generates a sensible signal, such as an optical signal, which indicates the operating condition of the pump and of the power supply. Additionally a filter removing particulate impurities from the water discharged by the cell may include a filter element arranged in the water path upstream from the cell. (Sinha-OEIS)

THE PRESENT SITUATION AND THE RATE OF SELF-PURIFICATION OF THE UPPER REACHES OF THE SUKHONA RIVER,
Akademiya Nauk SSSR, Leningrad. Inst. of Ozerovedeniya.
D. N. Aleksandrova, and T. D. Slepukhina.
Hydrobiological Journal, Vol. 13, (2), 1977, p 76-81. 3 tab, 2 fig, 8 ref. (translated from Russian).

Descriptors: *Water pollution effects, *Biodegradation, *Biological communities, Biology, Sediments, Self-purification, Benthos, Oligochaetes, Water quality, Hydrology, *Sukhona River, Phytoplankton, Zooplankton, Bacteria, Biomass, Biological diversity, USSR.

Studies on a 42 km long zone of the Sukhona river were made, testing for 26 hydrological, hydrochemical, and biological factors. Changes in biological processes and factors along the river were discovered. The pollution rates of self-purification of the water and bottom soils, based on the relative numbers of Oligochaeta, the index of species diversity of the macrobenthos and the ratio between the total numbers of bacteria and the numbers of saprophytes growing on beef-extract agar (and also on the BOD5) are estimated. Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 104, No WR 1, p 265-271, November 1978. 1 appen.

Descriptors: *Environmental engineering, *Legislation, *Government agencies, *California, *Urban planning, Natural resources, Conservation, Urban development.

Studies showed that California EIR's had become too large and costly. The documents did not help part-time city councilmen respond to problems. In some cases, the documents were prepared and then ignored. Despite these problems, the studies found that review of environmental impacts was valuable and should be improved. Following these studies, the California Legislature amended the law in 1976 to shorten EIR's, to focus the reports on environmental problems, and to require agencies to respond to those problems. A summary, a list of references, and a table of contents or index were required to help readers find critical information. Through a requirement for findings, public agencies are now required to solve environmental problems or to explain why the problems could not be solved. These changes provide more integration of environmental, economic and social concerns in the environmental analysis process. (Bell-Cornell)

WET/DRY COOLING SYSTEMS FOR FOSSIL-FUELED POWER PLANTS: WATER CONSERVATION AND PLUME ABATEMENT,
United Engineers and Constructors, Inc., Philadelphia, PA.
M. C. Hu, and G. A. Englesson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-276 625, Price codes: A13 in paper copy, A01 in microfiche. Report EPA-600/7-77-137, November 1977, 275 p, 38 fig, 38 tab, 14 ref, 16 append. 68-03-2202.

Descriptors: Environmental effects, *Cooling towers, *Powerplants, Cost analysis, Design, Design criteria, Fog, *Water conservation, Pollution.

This report presents the results of a design cost study for wet/dry cooling tower systems used in conjunction with 1000 MWe coal-fired power plants to reject waste heat dry tower systems can be designed to provide significant economic advantages over dry cooling while closely matching the dry tower's ability to conserve water. This economic advantage can be maintained by wet/dry systems which save as much as 98% of the make-up water required by wet towers. The advantage of wet cooling over wet/dry cooling may be small in areas with remote water supply sources. In areas where water costs are excessive, wet/dry cooling can reach economic parity with wet cooling. Ground fogging from low profile wet cooling towers can be reduced by design changes which increase the number of cells without significantly increasing the total evaluated cost of the wet cooling tower. In cases of restrictive site conditions or fogging limitations, wet/dry cooling towers may be used effectively at costs approximating those of enlarged wet towers. (Chilton-ORNL)

DESIGN AND ANALYSIS OF AQUATIC MONITORING PROGRAMS AT NUCLEAR POWER PLANTS,
Battelle Pacific Northwest Labs., Richland, WA.
D. H. McKenzie, L. D. Kannberg, K. L. Gore, E. M. Arnold, and D. G. Watson.
Available from the National Technical Information Service, Springfield, VA 22161 as PNL-2423, Price codes: A07 in paper copy, A01 in microfiche. PNL-2423, NRC-1; November 1977. 129 p, 42 fig, 17 tab, 36 ref, 1 append. DOE EY-76-C-06-1830.

Descriptors: Environmental effects, *Powerplants, *Monitoring, Aquatic life, Design, Sites, Control, *Aquatic environments.

This report addresses some of the problems of designing, conducting, and analyzing aquatic environmental monitoring programs for impact assessment. The concept of control and treatment station pairs, based on the hypothesis that the relationship between the two stations forming the pair can be estimated from the preoperational period and that this relationship holds during the operational period, is the fundamental basis for the experimental method proposed. The major problem in establishing station pairs is identified as being the location of the control station which must remain unaffected by the operation of the power plant. The control station must also be near enough to the power plant that the biological communities will respond to natural environmental changes consistently in the same manner. The collection of balanced data sets is also identified as an important concept in the design of aquatic monitoring programs. The report proposes guidelines for some of the problems encountered during the statistical analysis of data. (Chilton-ORNL)

CHEMICAL ADDITIVES FOR IMPROVEMENT OF OIL SPILL CONTROL,
Rensselaer Polytechnic Inst., Troy, NY.
W. H. Bauer, D. N. Borton, J. J. Bulloff, and S. Ross.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A009 019, Price codes: A09 in paper copy, A01 in microfiche. Final Report No. CG-D-83-75, August 1974. 133 p, 9 fig, 7 tab, 717 ref, 1 append. DOT-CG-33755-A.

Descriptors: *Oil spills, *Waste water treatments, *Chemcontrol, *Bibliographies, Water pollution sources, Oil pollution, Laboratory tests, Data collections, Entrainment, Polyethylene, Viscosity, Waste treatment, Coagulation, Waste treatment, Coagulation, Waste water treatment, Water pollution control, Water pollution abatement, Water pollution treatment.

Abstract literature and Coast Guard information were used to develop a base of information for this state of the art report. From this data, apparatus and methods were developed to study the effects of chemical additives for improving oil spill control. Sixteen types of oil and two highly purified hydrocarbon reference oils were tested with various chemical additives. The additives exhibiting the most effectiveness in improving oil control performance were then studied over a range of concentrations in the chosen test oil and at a selected concentration in other oils. Oil soluble polyethylenes and ethylene-propylene copolymers were found to be the most effective. The oil exhibited a wide range of viscosities and interfacial tensions, but they all showed initial droplet formation and entrainment at oil-water cocurrent velocities of about 0.5 knots. An extensive bibliography is provided. (Davison-IPA)

DEMONSTRATION OF INTERIM TECHNIQUES OF POLLUTED BEACHWATER,
Cleveland Dept. of Public Works, OH.
J. F. Weber.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 192, Price codes: A09 in paper copy, A01 in microfiche Report No. EPA-600/2-76-228, September 1976. 181 p, 64 fig, 48 tab, 4 ref, 9 append. 11020 EZW.

Descriptors: *Beaches, *Water pollution, *Lake Erie, *Water pollution abatement, Waste water treatment, Barriers, Disinfection, Chlorination, Water quality control, Public health, Organic wastes, Sewage, Municipal wastes, Outfall sewers, Swimming.

The contaminated beaches on Lake Erie bordering Cleveland were made safe for swimming through interim techniques designed to keep the beaches safe until long range goals could be implemented The beach areas became contaminated from combined sewer overflows, and floating debris. Physical barriers were designed to separate the lake water from the beach water, to keep out the sewer debris and to retard the diffusion of the disinfectant into the deep water. Floating debris was removed with nets and larger debris such as logs were removed with a bulldozer and a dump truck. Sodium hypochlorite diluted with fresh water provided a positive displacement of the water within the barriers and reduced the infiltration of the contaminated lake water into the enclosure. Streams and storm overflows with outfalls near the swimming areas were chlorinated to reduce bacterial levels. The three methods of reducing lakefront contamination were: (1) the addition of flow increasing polyelectrolytes into an interceptor sewer to reduce combined sewer overflow; (2) flushing lateral sewers of residential areas during dry weather, reducing the 'first slug' effect of settled solids during a storm; and (3) cleaning debris from rivers and streams before it reached the lake. Bacterial aftergrowth was studied to develop a method to optimize chlorination as a disinfectant. (Davison-IPA)

ISSUES IN WASTE WATER TREATMENT FACILITY LOCATION,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Urban Planning and Policy Development.
M. R. Greenberg.
Growth and Change, Vol. 3, No. 1, p. 38-43, January, 1972. 1 tab. (OWRT-C-1629(No. 3147)(7).

Descriptors: Water resources, *Urban land use, *Sewerage, *Waste water treatment, Planning, Water supply, Environmental effects, Water quality, Locating, Regions, *Treatment facilities, Facility location, Regionalization.

The principle usually followed in waste water treatment plant location is to establish regional control with a minimum number of plants, frequently one at the lowest point in each drainage system. State and county government generally support this concept. The Federal Water Quality Act recommends development of comprehensive river basin studies, encouragement of interstate compacts, and requirement of conformability with basin studies for federal grants, with a 10% incremental grant if the plant is part of a metropolitan regional plan. The federal program goal is a drastic reduction of pollution loads of waste water dischrges by 1975. Effectiveness of regionalization can be evaluated from the perspectives of planning, economics, and environment. The regional plant has the potential of halting the sparse settlement of undeveloped areas by higher income populations because its greater capacity will permit development at densities greater than the small local plant. Development can be expected to follow the location of large trunk lines. Impact of regional plants on cities is debatable. Industries required to upgrade waste water treatment may prefer to close or relocate, with resultant loss of employment for monitory groups, rather than pay higher user charges for the regional system. Significant economies of scale design, construction, and operation favor the regional treatment plant. Environmentally, a regional system would enhance public water supplies and recreational activities Streams would not receive effluents in vast stretches. Groundwater supplies would not be polluted by malfunctioning septic tank systems. However, costly monitor and storage systems must be provided in treatment plants to prevent disastrous discharge of toxic wastes. (Edwards - North Carolina)

Descriptors: *Public participation, *Advisory groups, *Citizen participants, Decision-making, *State governments, *Local governments, *North Carolina.

The evaluation of methods of public participation in water quality planning is being undertaken by the Public Participation Study Group of the Department of City and Regional Planning, UNC-CH. A completed 208 planning process was studied to identify issues and problems of public participation in water quality planning in North Carolina context. The overall research includes description and analysis of the various participation activities undertaken during preparation of the statewide plan, from state level advisory groups to local involvement in small area plans. The primary aim is to compare the effectiveness of different methods of public participation during the stages of the planning process. (Kiger-North Carolina).

Descriptors: *Recreation, *Land development, *Vacation sites, Water supply, Sewage disposal, *North Carolina.

In recent years the North Carolina mountains have faced a rapid influx of second home and recreational land development. Unfortunately, increased land development in this region is resulting in the gradual degradation of once pristine waters. At the same time there is increased demand for high quality water for human consumption. While some water resources problems would have resulted from any kind of development, many of them can be traced to particular development and construction practices which have been recognized by experts as particularly destructive to the environment. Numerous standards for land development focusing on minimizing the adverse effects on the area's water resources have been identified. The purpose of these criteria and standards is to facilitate the development of an evaluation form which can be used to analyze specific second home projects regarding their impact on the area's water resources. Standards and criteria were selected largely on the basis of their susceptibility to field measurement. As such, very few engineering or detailed design criteria were included. The dominant emphasis was on site criteria, such as lot size standards and the appropriate spacing of different facilities, which directly relate to water quality. These land development standards have been divided into six major functional categories: (1) water supply; (2) sewage disposal; (3) slopes, stormwater runoff and sedimentation; (4) floodplains; (5) open space and recreation; and (6) golf course development. While the inter-relationship between these six areas is quite significant, it is still possible to identify specific standards and criteria relating to each functional area. (Kiger-North Carolina)

INSECT PEST PROBLEMS ASSOCIATED WITH WASTEWATER OXIDATION LAKES IN MICHIGAN,
Michigan State Univ., East Lansing. Dept. of Entomology
R. W. Merritt
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 610. Price codes: A03 in paper copy, A01 in microfiche. Institute of Water Research, Michigan State University Project Completion Report, December, 1978. 46 p, 8 fig, 4 tab, 32 ref. OWRT A-085-MICH(1), 14-31-0001-5022.

Descriptors: *Waste water pollution, *Midges, *Oxidation lakes, *Insects, Sewage, Diptera, *Oxidation lagoons, *Environmental factors, *Distribution, Abundance, *Michigan, Larvae.

The distribution and abundance of larval Chironomidae were investigated in the first and last lakes of a 4-lake sewage oxidation system. Chironomid species composition and adult seasonal occurrence were examined and the potential of certain species to become pests of man was evaluated. A stratified random sampling program was employed to quantitatively sample larvae in Lakes 1 and 4. Each lake was stratified by depth, distance from the influent site, and wind. Samples were taken during the summer and early fall of 1976 and during late spring and early summer 1977. Chironomidae was the dominant subfamily in both lakes initially the Orthocladiinae gradually becoming dominant in Lake 4 by early summer 1977. The patterns of larval distribution and abundance in Lakes 1 and 4 indicate that the Chironomidae actively responded to differences in oxygen and nutrient availability in the sediments by migrating to areas offering favorable conditions. Oxygen appeared to be the limiting factor in Lake 1, nitrogen and phosphorus in Lake 4

ENVIRONMENTALIZING AGRICULTURAL PRODUCTION CONTROL POLICIES,
Illinois Univ. at Urbana-Champaign. Dept. of Agricultural Economics.
W. D. Seitz, and R. G. F. Spitze.
Journal of Soil and Water Conservation, Vol. 28, No. 2. p. 61-64, 1 fig, 10 ref. March-April 1973. OWRT A-061-ILL(3), 14-31-0001-3813.

Descriptors: Agriculture, *Environmental control, *Economics, *Land management, Soil conservation, Agriculture policy, Policy alternatives, Watershed linear programming.

Ongoing public agricultural policies, which are the results of years of compromise among parties with competing interests reveal little sensitivity to their effects on environmental quality. Public price, income and production control policies in agriculture relate to problems of soil erosion and sedimentation. Current critical review of the 1970 Agricultural Act suggests that land retirement programs for the future are likely to be changed. Various public policy proposals are examined which alter the current set-aside program as a means of increasing agriculture's performance from environmental quality perspective. Possible program changes include (1) alteration in requirements for program participation to include soil conservation practices, (2) intrastate payment variation reduction, (3) interstate payment variation reduction, and (4) use of incentives for improved management practices on all farms. The first three proposals involve modification of the price, income, production control program. These proposals would shift production to areas that are less prone to erosion and extend the use of soil conservation practices on participating farms. The final proposal would tend to improve management practices of all farm operations so as to reduce the level of sedimentation.

COLLOID FREE PRECIPITATION OF HEAVY METAL SULFIDES,
R. M. Schlauch.
U.S. Patent No 4,102,784, 7 p, 2 tab, 2 ref; Official Gazette of the United States Patent Office, Vol 972, No 4, p 1614, July 25, 1978.

Descriptors: *Patents, *Water pollution treatment, *Water quality control, Water purification, Heavy metals, Chemical precipitation, Separation techniques, Sulfides, Ions.

In a method of precipitating heavy metal pollutant ions from an aqueous solution by adding a metal sulfide having a higher equilibrium sulfide ion concentration than the sulfide of the heavy metal pollutant, the metal sulfide is added in the form of a slurry. The slurry is prepared in a specific manner to cause large particle size of the precipitate. The object of the invention is to provide a process of removing heavy metal pollutants as a substantially large size precipitate without the formation of a colloid. The colloid formation of heavy metal sulfides can be avoided or minimized by slow addition of the solution of ferrous ions to a solution of sulfide ions at a controlled rate in the absence of heavy metal pollutant ions, and adding the resulting slurry of large particle size precipitate of ferrous sulfide to the stream containing the metal pollutants to be removed. (Sinha-OEIS)

SYSTEM AND METHOD FOR COOLING HOT WATER FROM INDUSTRIAL PLANT COOLING USE,
R. H. Rasmussen.
U.S. Patent No 4,117,683, 9 p, 8 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 975, No 1, p 49, October 3, 1978.

Descriptors: *Patents, *Industrial water, *Thermal pollution, *Water pollution treatment, *Water quality control, Water cooling, Cooling water, Harbors, Temperature, Port improvement.

A system for thermal disposal and port improvement comprises an industrial plant constituting a source of hot cooling water which must be cooled. It is located along a navigable river, lake or ocean--the body of water constituting a port. Hot cooling water is delivered from the industrial plant to the port water to cool the water throughout the year and to prevent it from freezing shut in winter. Cool cooling water from the port water is delivered to the industrial plant. The method of cooling hot cooling water from the industrial plant comprises removing the hot cooling water as an effluent stream and directing the stream to the top portion of a holding and cooling lake open to the atmosphere to effect reduction of the temperature by evaporation and conduction, and withdrawing cool cooling water from the bottom portion of the lake and sending it back to the industrial plant for cooling purposes. METHOD FOR SLIME CONTROL,
H. Finkelstein.
U.S. Patent No. 4,119,537, 4 p, 2 tab, 5 ref, Official Gazette of the United States Patent Office, Vol 975, No 2, p 671, October 10, 1978.

Descriptors: *Patents, *Water treatment, *Water purification, *Industrial water, Water pollution treatment, Water quality control, Slime, Microorganisms, Inhibitors, Pulp and paper industry.

These chemical formulations and agents are to be used as water treatment agents in industrial water systems to control and improve such factors as bacteriological contamination, pollution and cleanliness. Chemical limes, hydrosulfites and dispersants are used together in a formulation, in relatively low concentrations, to primarily inhibit and destroy slime and microorganisms. No toxicants as such are needed. In addition, the chemical lime particles can be coated to give a delayed and safer reaction with water and to give reduced dusting. (Sinha-OEIS)
W79-03791

ARRANGEMENT FOR DISPOSING OF FLUID FLOATING MATTER,
Mitsui-Osaka Maritime Construction Co. Ltd. (Japan). (Assignee).
S. Makaya.
U.S. Patent No. 4,119,541, 15 p, 22 fig, 1 tab, 19 ref; Official Gazette of the United States Patent Office, Vol. 975, No. 2, p. 672, October 10, 1978.

Descriptors: *Patents, *Oil pollution, *Water pollution treatment, *Water quality control, Oily water, Red tide, Floating, Separation techniques, Flow separation, Oil recovery.

Floating matter such as red tide or discharged oil floating on water surface, e.g., floating on the ocean surface, can be removed completely. The invention is designed for a small amount of fluid floating matter spreading over a vast area such as rainbow-colored membrane. Also it is possible not only to recover the fluid floating matter but also makes it possible to remove and recover a larger amount of fluid floating matter through a continuous process. A recovery-separation tank is used with an inner water surface lower than that of the outside. The floating matter, such as oil floating on the surface of water outside the recovery-separation tank is drawn in through an inlet. The floating matter and water are separated into layers which flow into the recovery-separation tank and a drain pump discharges the water lying in the lower portion of the tank. (Sinha-OEIS)

OIL SLICK REMOVAL AND RECOVERY SYSTEM,
R. D. Ellis.
U.S. Patent No 4,120,788, 9 p, 8 fig, 2 tab, 8 ref; Official Gazette of the United States Patent Office, Vol 974, No 3, p 1101, October 17, 1978.

Descriptors: *Patents, *Oil pollution, *Water pollution treatment, Water quality control, Absorption, Foaming, *Oil slicks, Containment, Oil recovery, Foam sandwich.

This system provides a method by which oil slicks are contained, removed and recovered from a water surface by providing a layer of surbent material, such as foam, under the oil slick and above the oil slick to sandwich the oil. A foam spreading apparatus is provided which includes a floating boom attached to a towing vessel, the boom having spreader units placed above and below the oil slick to discharge the foam forming a sandwich for the oil slick. The apparatus includes a harvesting vessel for cutting and shredding the foam sandwich and a recovery for separating the oil from the strips. (Sinha-OEIS)

PROCEEDINGS OF THE 1977 OIL SPILL RESPONSE WORKSHOP.
National Coastal Ecosystems Team, NSTL Station, MS.
Publication No. FWS/OBS/77-24, September 1977. 158 p. Fore, P.L. (Ed.).

Descriptors: *Oil spills, *Oil pollution, *Planning, Water pollution effects, Environmental effects, Wildlife habitats, United States, *Outer Continental Shelf, Polluton Contingency Plan.

An Oil Spill Response Workshop was held in Metairie (New Orleans), Louisiana, from 15 to 17 February 1977 to improve the Service's capability and effectiveness in responding to oil spills. The workshop was cosponsored by the Office of Migratory Bird Management and the Office of Biological Services, Fish and Wildlife Service, U.S.

Department of the Interior. THe objectives of the workshop were: to discuss overall Service responsibilities, capabilities, and procedures in responding to spills; to disseminate current information concerning biological impacts of oil on wildlife, techniques for minimizing impacts, and other information essential for developing an effective response by the Service to oil spills; to present views of other agencies and organizations on their role in responding to oil spills and their relationship to the U.S. Fish and Wildlife Service; and to Critique the recently drafted oil spill contingency plan of the Service and assist in preparing a final plan. (See W79-03831 thru W79-03840)
W79-03830

STATUS AND FUTURE TRENDS IN OIL SPILLS AND IMPLICATIONS FOR THE U.S. FISH AND WILDLIFE SERVICE,
Fish and Wildlife Service, Washington, DC. Office of Migratory Bird Management.
A. E. Fletcher.
In: Proceedings of the 1977 Oil Spill Response Workshop, held Metairie, LA on 15-17 February 1977, Fish and Wildlife Service Biological Services Program Publication No. FWS/OBS/77/24, September 1977. p 11-22, 5 fig, 3 tab, 14 ref.

Descriptors: *Oil spills, *Oil pollution, *Water pollution effects, *Planning, Wildlife habitats, United States, *Outer Continental Shelf.

It may not be possible for the U.S. Fish and Wildlife Service to be completely prepared to respond to oil spills at every site where they might occur in the United States, but it is possible to take steps now in those areas where spills are most likely to occur. Service personnel who are located near key oil pollution areas can be assigned to prepare for and respond to pollution incidents; supplies can be stockpiled within easy transport distance to implement bird dispersal and other field actions; surrounding areas can be examined before pollution incidents to determine what locations are known to be particularly critical and should be protected first if threatened by oil; and good communications should be established with State agencies and private organizations that may respond to pollution incidents in these areas. Without such preparation, unnecessarily high direct waterfowl mortality may result and significant indirect fisheries and wildlife losses might result from destruction of important wildlife and fisheries food resources and contamination of breeding areas. The degree of effectiveness of Service actions will be limited considerably by the circumstances of the spill and the species and kinds of habitats involved. However preparations should be made to respond rapidly and effectively in many of these locations where oil spills happen frequently. (See also W79-03830)(Sinha-OEIS)
W79-03831

NATIONAL OIL AND HAZARDOUS SUBSTANCES POLLUTION CONTINGENCY PLAND AND FEDERAL RESPONSIBILITIES.
Environmental Protection Agency, Washington, DC.
R. E. Hess.
In: Proceedings of the 1977 Oil Spill Response Workshop, held Metairie, LA on 15-17 February 1977, Fish and Wildlife Service Biological Services Program Publication No. FWS/OBS/77-24, September 1977. p 23-28, 1 fig.

Descriptors: *Oil pollution, *Legislation, *Water pollution effects, *Planning, Hazards, Water quality control, Cleaning, Coasts, Estuaries, *Outer Continental Shelf, National Oil and Hazardous Substances Pollution Contingency Plan, Clean-up, Government coordination, Hazardous substances.

The National Oil and Hazardous Substances Pollution Contingency Plan provides for efficient, coordinated, and effective action to minimize damage from oil and hazardous substances discharges. Possibly, its most important aspect is that of specifying that there should be an On-Scene Coordinator (OSC) to serve as the single Federal executive agent on-scene to direct cleanup and removal operations. The plan accomplishes its purpose by establishing a flexible organization consisting of the OSC and advisory groups capable of providing expertise and assistance as required. Generally, Federal On-Scene Coordinators are furnished by the Coast Guard for the coastal waters, the Great Lakes, and ports and harbors, and by the Environmental Protection Agency (EPA) for inland waters. (See also W79-03830) (Sinha-OEIS)

CALIFORNIA'S RESPONSE TO POLLUTION INCIDENTS,
California State Dept. of Fish and Game, Long Beach.
W. H. Putman.
In: Proceedings of the 1977 Oil Spill Response Workshop, held Metairie, LA on 15-17 February 1977, Fish and Wildlife Service, Biological Services Program Publication No. FWS/OBS/77-24, September 1977. p 33-36.

Descriptors: *California, *Oil spills, *Planning, Pollution abatement, Environmental effects, Governments, Water quality control, *Outer Continental Shelf, Pollution Contingency Plans

The California Oil Spill Contingency Plan reconciles any differences in emergency planning by providing the local governments with all the information developed by the Federal and State On-Scene Coordinators (OSC) and including them in the decisionmaking process at the operation centers. This is accomplished by the local government's preassigning a representative who will have the authority to speak for his community and to commit personnel, equipment, and facilities to help mitigate the pollution incident. He will also have the responsibility to keep his local levels of government informed of the corrective or contemplated actions agreed upon at the operations center. (See also W79-03830) (Sinha-OEIS)

INDUSTRY VIEWS AND RESPONSIBILITIES IN OIL SPILL/WILDLIFE OPERATIONS,
American Petroleum Inst., Washington, DC
K. G. Hay.
In: Proceedings of the 1977 Oil Spill Response Workshop, held Metairie, LA on 15-17 February 1977, Fish and Wildlife Service Biological Services Program Publication No. FWS/OBS/77-24, September 1977. p 37-42.

Descriptors: *Oil spills, *Water quality control, *Water pollution effects, Wildlife conservation, Legislation, Industries, Oil industry, Training, *Outer Continental Shelf, Cleanup.

Most oil spills--large or small--are directly attributable to human error. The most effective means of preventing spills, therefore, is to employ skilled and attentive crews. To this end, oil companies have developed innovative training programs. The oil industry has conscientiously sought to control and clean up spills and is spending millions of dollars each year on new technologies and training programs to improve tanker efficiency and to reduce the potential for accidents. The petroleum industry has long supported legislation for the establishment of a huge 'superfund,' which could be used immediately to handle expenses involved in the cleanup of spills. The fund would be replenished by the spiller. The American Petroleum Institute (API) has initiated various research projects and other efforts to solve the many complex biological problems that occur in achieving high bird survival levels and a rapid return to the wild and reasonable costs. CONTAINMENT AND RECOVERY TECHNIQUES FOR SPILLED OIL IN THE MARINE ENVIRONMENT,
National Coastal Ecosystems Team, NSTL Station, MS.
M. J. Donohoe.
In: Proceedings of the 1977 Oil Spill Response Workshop, held Metairie, LA on 15-17 February 1977, Fish and Wildlife Service Biological Services Program Publication No FWS/OBS/77-24, September 1977. p 69-82, 15 fig

Descriptors: *Oil spills, *Oil pollution, *Pollution abatement, *Water pollution treatment, Environmental effects, Skimming, Equipment, Water quality control, *Outer continental shelf, *Oil recovery, Containment.

The containment and recovery of oil discharges through the use of commercially available equipment has resulted in a more timely and efficient response to spill incidents. Appropriate materials or devices are available for use in local conditions throughout the United States. Knowledge of specific equipment limitations and appropriate techniques will result in overall minimization of adverse environmental damage as a result of a spill incident. The fact that one must be prepared to act rapidly, evaluating and programming responses prior to real incidents, is without doubt the most important 'technique' for the containment and recovery of oil spills in the marine environment. (See also W79-03830) (Sinha-OEIS)
W79-03838

CHEMICAL OIL DISPERSING AGENTS AND THEIR FEASIBILITY FOR USE,
Exxon Research and Engineering Co., Florham Park, NJ
G P Canevari.
In: Proceedings of the 1977 Oil Spill Response Workshop, held Metairie, LA on 15-17 February 1977, Fish and Wildlife Service Biological Services Program Publication No NWS/OBS/77-24, September 1977. p 83-94, 4 fig, 1 tab, 8 ref.

Descriptors: *Oil spills, *Water pollution treatment, Pollution abatement, Dispersion, Equipment, Mixing, Surfactants, *Outer Continental Shelf, Chemical dispersants.

There is increased recognition that there is a role for chemical dispersants in minimizing damage from oil spills. The improved effectiveness afforded by the self-mix dispersant system has been demonstrated. In addition, several organizations are planning major field demonstrations of this type of dispersant system. In these experiments, the water column will be sampled in the environs of the dispersed oil in order to establish the rate of dilution of oil concentration. The resolution of this important aspect (i.e., the dilution and resultant toxicity of dispersed oil) will help place the various laboratory bioassays, wherein dilution of the dispersed oil concentration is not considered, in a more proper perspective. Conventional (mixing required) dispersants will continue to be used in the immediate future where mixing energy is conveniently available and the spill size is relatively small. Hardware (sprays, booms, mixing breaker boards, etc.) have been well-developed for boat applications. In this regard, some dispersants are now formulated as concentrates (High surface-active agent content) for greater oil-to-chemical treatment ratios, thereby permitting workboats to

remain on station longer before having to replenish supplies. (See also W79-03830) (Sinha-OEIS)
W79-03839

RESTORATION OF OIL-CONTAMINATED SHORELINES,
URS Co., San Mateo, CA.
R. W. Castle.
In: Proceedings of the 1977 Oil Spill Response Workshop, held Metairie, LA on 15-17 February 1977, Fish and Wildlife Service Biological Services Program Publication No FWS/OBS/77-24, September 1977. p 105-112, 2 ref.

Descriptors: *Oil spills, *Beaches, *Shores, *Coasts, *Water pollution effects, Environmental effects, Sediments, *Outer Continental Shelf, Cleanup.

With the possible exception of the use of heavy equipment for sandy beach cleaning, a definitive and effective state-of-the-art for restoration of oil-contaminated shorelines is nonexistent. However, common sense applications of the knowledge and resources that are presently available can provide acceptable interim actions. Each restoration situation has its own peculiarities and requirements. If several basic assumptions are adhered to, the best practical restoration decisions should result. These assumptions include: any activity will have some effect on the environment. The restoration procedure and supporting activities (i.e., access, disposal, etc.) must not result in more environmental damage than caused by the oil itself. The restoration procedure should remove (or move to a position where recovery is possible) a maximum amount of contaminant with a minimum amount of disturbance, modification, or removal of the habitat. Extensive efforts resulting in low recovery yields are generally antiproductive and should be avoided. In some cases, no action at all is a viable alternative. (See also W79-03830) (Sinha-OEIS)

ECONOMIC ANALYSIS, ROOT CONTROL, AND BACKWATER FLOW CONTROL AS RELATED TO INFILTRATION/INFLOW CONTROL,
American Public Works Association, Chicago, IL.
R. H. Sullivan, R. S. Gemmell, L. A. Schafer, and W. D. Hurst.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-279 052, Price codes: A07 in paper copy, A01 in microfiche. Report EPA-600/2-77-017a, December 1977. 102 p, 17 fig, 13 tab, 17 ref. 803151.

Descriptors: *Root control, *Backwater, *Roots, *Tide gates, *Sewers, *Costs, Sewerage, Cost-effectiveness, Economics, Infiltration, Inflow, Root systems, Flooding, Herbicides, Vaporooter, Mechanical control, Chemcontrol, Pipes, Backwater gates, Manholes.

On-site investigations and questionnaires were used to compile information (including costs) on control and elimination of infiltration/inflow flows to sanitary sewer systems. Major sources of infiltration are pipe defects, manholes, service connections, and poor initial construction. Major inflow sources are open manholes, roof leaders, illegal connections, catch basins, and yard and ground drains. It is seldom cost-effective to correct all infiltration points and some types of inflow. Intrusion of tree and shrub roots is a major sewer system problem. Mechanical cleaning is initially effective, but seems to cause worse root problems later. Of chemical control methods, Vaporooter is the most effective and is considered safe for employees and surface plants with recommended precautions. Foam also appears effective, but flooding or application of chemicals through manholes are not recommended. Roots can be excluded by use of newly developed pipe and sealer designs. Tide gates are considered satisfactory, though frequent maintenance is required to correct fouling and sticking, which represent about 60% of malfunctions. Only 7% of gate failures are reported due to corrosion. A major problem is accessibility. Cast iron gates have a longer service life than timber gates and steel pontoon gates, which decay or corrode after about 10 years. Three additional volumes (Appendices, Product and Equipment Guide, and Manual of Practice) accompany this report. (Lynch-Wisconsin)

PERMISSIBLE POLLUTION LEVELS OF WATER BODIES,
Moscow State Univ. (USSR). Dept. of Biology.
N. S. Stroganov.
In: Proceedings of the First and Second USA-USSR Symposia on the Effects of Pollutants Upon Aquatic Ecosystems - Volume I, Environmental Protection Agency, Report EPA-600/3-78-076, p 1-10, 1978. 3 fig, 1 tab.

Descriptors: *Water quality standards, *Water quality control, *Self purification, *Waste assimilative capacity, USSR, Baseline studies, Water quality, Water chemistry, Microorganisms, Industrial wastes, Chemical wastes, Nitrification, Microbial degradation, Chemical degradation, Biochemical oxygen demand, *Mineralization.

In order to establish the maximum permissible level of pollution, beyond whose limits one cannot go without disrupting the use of the water, one should: first, determine the chief water users for multiple utilization of the water body, and, secondly, determine the main water quality requirements. The maximum permissible level of pollutant emission is limited by the water body's processes of self-purification, especially microorganisms. Their capability and the rate of decomposition of pollutants must be appropriate to the quality and quantity of pollutants discharged. (See also W79-03906) (EIS-Deal)

NATIONAL CONFERENCE ON MANAGEMENT OF NITROGEN IN IRRIGATED AGRICULTURE.
Proceedings of National Conference held in Sacramento, California, May 15-18, 1978. Sponsored by National Science Foundation, Environmental Protection Agency, University of California. Published by the Department of Soil and Environmental Sciences, University of California, Riverside, 1978. 442 p. $13.00.

Descriptors: *Nitrogen, *Nitrogen cycle, *Nitrates, *Irrigated land, Water quality, Water management(Applied), *Conferences.

These proceedings represent a National Conference on Nitrogen Management in Irrigated Lands, designed to bring together users representing a diversity of interests throughout the country for an integrated review of the findings from the comprehensive national research effort. The accumulated information needs to be utilized as fully as possible by the many individuals and organizations making decisions in current water quality planning. This will help ensure the emergence of appropriate and viable solutions to our water quality problems--solutions that are sensitive to both local and national needs and priorities. NITROGEN FORMS AND CYCLING IN RELATION TO WATER QUALITY,
Agricultural Research Service, Durant, OK. Water Quality Management Lab.
R. G. Menzel.
In: National Conference on Management of Nitrogen in Irrigated Agriculture, p 33-52, 1978. 3 tab, 43 ref.

Descriptors: *Water quality, *Nitrogen, Nitrogen compounds, *Nitrogen cycle, Nitrogen fixation, Denitrification, Eutrophication.

The intended use of water determines the significance of various forms of nitrogen in water quality. Upper limit concentrations have been recommended for several forms of nitrogen in water used for public water supplies, freshwater aquatic life, marine aquatic life, and agricultural uses. The concentrations are lowest for cyanide, and increase in the order ammonium, nitrite, and nitrate. Nevertheless, nitrate is more often of concern in water quality than are the first three forms of nitrogen. Much of the total nitrogen in surface waters occurs in particulate or dissolved organic forms. Plant growth is often excessive when the total nitrogen concentration exceeds 0.5 mg/l if other nutrients are adequately supplied and growth conditions are favorable. Nitrogen supply limits growth in many ocean areas and in a few lakes, mainly eutrophic ones. Nitrogen fixation by blue-green algae tends to correct nitrogen deficiencies. Denitrification by bacteria tends to correct excesses. These features indicate that high nitrogen concentrations may be an effect, rather than a cause, of eutrophication. SOURCES OF NITROGEN FOR CROP UTILIZATION,
Potash/Phosphate Inst. Manhattan, KS.
L. S. Murphy.
In: National Conference on Management of Nitrogen in Irrigated Agriculture, p 61-107, 1978. 23 tab, 40 ref.

Descriptors: *Nitrogen, Fertilizers, *Crop production, Nitrogen fixation, Corn(Field), Soybeans, Alfalfa, Symbiosis, Ammonium compounds, *Irrigation water, Water pollution control.

Nitrogen fertilization of crops is essential for maximum food production. Nitrogen from organic matter in the soil declines with continued cultivation to the point that supplemental nitrogen applications are necessary. Supplemental sources of nitrogen for crop production include symbiotically fixed nitrogen from legumes, nonsymbiotically fixed nitrogen from free-living organisms in the soil, inorganic nitrogen from lightning discharges and industrial emissions, industrially fixed nitrogen and nitrogen from various waste products. Recommendations for nitrogen applications in either dryland or irrigated agriculture are based on crop need as determined by agricultural research. Soil analysis is an important tool in determination of needs. Use of present and future recommendations will both maximize production of food and maintain environmental quality. LEACHING OF NITRATE FROM SOILS,
Washington State Univ., Pullman. Dept. of Agronomy and Soils.
B. L. McNeal, and P. F. Pratt
In: National Conference on Management of Nitrogen in Irrigated Agriculture, p 195-230, 1978. 4 fig, 5 tab, 35 ref.

Descriptors: *Nitrates, Nitroge, *Leaching, Irrigated land, Denitrification, Waste disposal, Soils.

Calculation of soil solution nitrate concentrations, and of mass emissions of nitrate, are illustrated. Estimation of average water flux from nitrate/chloride ratios, and from drain field outflows, are discussed. The high potential for nitrate leaching from irrigated animal and municipal waste disposal sites is mentioned, with stress being placed on the high denitrification potential at many such sites, because of high soluble carbon loadings, high soil microbe levels, and rapid oxygen depletion. Root-zone and subsoil nitrate-nitrogen values are provided for typical croplands of southern California and central Washington. Such values are related to irrigation management and to downward water flux. Crop differences in ability to utilize all soluble nitrate from the soil solution are stressed, and some management alternatives for preventing deep percolation losses of nitrate are detailed. Predictions of nitrate leaching losses from data for nitrogen application rate and drainage water volume are discussed. Typical predictions are presented and are compared to experimentally-measured values. Overprediction of nitrate leaching estimates for some furrow-irrigated tracts in the Pacific Northwest is demonstrated. (See also W79-03941) (Skogerboe-Colorado State)

MONITORING WATER FOR NITROGEN LOSSES FROM CROPLANDS,
California Univ., Davis. Dept. of Land, Air and Water Resources.
K. K. Tanji.
In: National Conference on Management of Nitrogen in Irrigated Agriculture, p. 251-263, 1978. 10 ref.

Descriptors: *Nitrogen, *Return flow, Irrigated lands, *Monitoring, Water quality.

This paper reviews monitoring for nitrogen in surface and subsurface return flows from irrigated lands. Presented are the elements of a monitoring program: objectives of monitoring, parameters to be measured, sampling programs that include site selection, sampling frequency and sampling method, laboratory methods for nitrogen determinations, requirements for resources and facilities, evaluations of collected data and other supporting information and data, and dissemination of monitored results. Each of these elements are appraised and a conclusion is drawn on monitoring waters for nitrogen losses from croplands. (See also W79-03941) (Skogerboe-Colorado State)

ESTIMATING THE INFLUENCE OF SOIL RESIDENCE TIME ON EFFLUENT WATER QUALITY,
California Univ., Riverside. Dept. of Soil and Environmental Sciences.
W. A. Jury.
In: National Conference on Management of Nitrogen in Irrigated Agriculture, p 265-290, 1978. 6 fig, 1 tab, 30 ref.

Descriptors: *Effluents, *Water quality, Travel time, Drainage, Tile drainage, Nitrates, Soils.

Models are proposed to calculate the time required for dissolved chemicals to move from the soil surface to either underlying groundwater in the case of free drainage or to tile drain outlets in the case of artificial drainage. The models assume that dissolved substances are transported primarily by moving soil solution, which displaces soil water initially present in the wetted pore space (piston flow approximation). For free drainage, this results in a single travel time equation which is a function of soil water content and drainage volume. For tile drainage, the travel time depends also on the surface entry point, which is illustrated with a graph showing residence time as a function of place of origin. This graph may be used for all tile drain systems. Calculations are presented to show the influence of travel time on drainage concentrations, illustrating also how tile drain concentrations are a mixture of contributions from different parts of the field arriving at different times. Field studies of salt movement are analyzed and compared to the model predictions, with differences explained on the basis of soil variability or stagnant water in part of the wetted pore space. ECONOMIC CONCEPTS AND POLICIES RELATED TO CONTROLLING NON-POINT SOURCE POLLUTION STEMMING FROM AGRICULTURE,
Washington State Univ., Pullman. Dept. of Agricultural Economics.
N. K. Whittlesey, and P. W. Barkley.
In: National Conference on Management of Nitrogen in Irrigated Agriculture, p 333-353, 1978. 14 ref.

Descriptors: Pollution abatement, Water pollution sources, Agriculture, *Nonpoint pollution sources, Water pollution control.

This paper describes the role of economics in solving non-point source pollution problems in terms that are understandable for the noneconomist. An economist attempts to watch over the process of converting natural resources into marketable commodities to assure that the process achieves the greatest possible good for members of society. Economic tools are well equipped to handle this process for goods and resources known as private property, those items used exclusively by the individual owners. Unfortunately, most pollution problems occur through the use and misuse of public property, those items owned and used jointly by all members of society. Air and water are the most common examples of public property. The paper describes economic concepts and public policies that are useful for internalizing the costs caused by pollution and abating or solving pollution caused problems. The concepts of opportunity cost and income distribution and their role in pollution abatement are discussed. Methods of choosing levels of abatement include the extremes of zero pollution and that which can be achieved by best management practices. The economic and social optimum probably lies between these extremes. Arbitrary standards are sometimes imposed as a compromise between the extremes of zero pollution and no abatement in an effort to approximate optimal levels of abatement. ECONOMIC IMPACTS OF CONTROLLING NITROGEN CONCENTRATION AND OTHER WATER QUALITY DETERMINANTS IN THE YAKIMA RIVER BASIN,
North Dakota State Univ., Fargo. Dept. of Agricultural Economics.
G. H. Pfeiffer, and N. K. Whittlesey.
In: National Conference on Management of Nitrogen in Irrigated Agriculture, p 415-442, 1978. 4 fig, 4 tab, 9 ref.

Descriptors: Water quality, *Nitrogen, *Economic impact, *Return flow, Pollution abatement, *Washington, *Yakima River Basin(Wash).

The nonpoint source nature of water quality degradation caused by irrigation return flow makes control nearly impossible with traditionally effective measures, such as limitations or taxes on effluents. As a consequence, control or taxation of those inputs to production which are involved in effluent input-output relationships is a possible alternative. In the Yakima River Basin, three determinants of river water quality were identified: nitrogen concentration, river water temperature, and soil erosion by irrigation water. Among the pollution control policies considered for effectiveness, producer cost, and social cost were taxation of nitrogen fertilizer, increasing the charge for irrigation water, reduction of irrigation water rights, and restrictions on the types of irrigation systems used. Results showed that policies which affect the level of one pollutant may or may not significantly affect the levels of others. Furthermore, policies taxing or charging for inputs, such as fertilizer and irrigation water, cause a substantial reduction in producer income if acceptable water quality is to be attained. Therefore, water quality policy formulation and evaluation should consider the interactions which exist among water quality determinants and considerations of both the expected benefits of improved water quality and the level and distribution of improvement costs. NITROGEN BALANCES FOR THE SANTA MARIA VALLEY,
California Univ., Riverside. Dept. of Soil and Environmental Sciences.
L. J. Lund, J. C. Ryden, R. J. Miller, A. E. Laag, and W. E. Bendixen.
In: National Conference on Management of Nitrogen in Irrigated Agriculture, p. 395-413, 1978. 6 tab, 7 ref.

Descriptors: *Nitrogen, Nutrient removal, Denitrification, Vegetable crops, Leaching, *Santa Maria Valley(Calif), *California model studies.

A simplified steady-state model has been used to develop nitrogen balances in the Santa Maria Valley, California. Balances have been developed for selected management units and for the valley as a whole. The balance developed for a field cropped with vegetables for the past twelve years showed that 30% of the applied nitrogen was removed in harvested crop, 37% was leached below the root zone and 33% was unaccounted-for, which was attributed to gaseous losses of nitrogen as products of denitrification. Direct field measurement of denitrification over an eight-month period at one site in the same field found a 29% loss of the applied nitrogen. The first estimation of the nitrogen balance in the valley attributed 24% of the applied nitrogen to removal in harvested crops, 39% to leaching and 37% to denitrification. Descriptors: Return flow, *Economic prediction, Water quality, *Management, Environmental effects, Economics, *Methodology, *California, *San Joaquin Valley(Calif).

Section 208 of Public Law 92-500 (The Federal Water Pollution Control Act Amendments of 1972) requires the preparation of areawide waste treatment management plans. Agricultural related pollutants such as subsurface drainage water and irrigation tailwater containing nutrients, sediment and pesticides must be identified and procedures and methods to control such discharges specified. Under Section 208, the reduction of pollutants may be achieved by adopting a set of 'best management practices' that could include varying economic incentives, establishing resource use controls and suggesting public resource investment. To determine the economic and environmental impact of 'best management practices,' a methodology must be derived that specifies the relationship of agricultural production practices to water and land quality and the economic cost and benefits of changing those practices. Such a methodology is being developed to systematically collect and organize physical and economic data, specify the physical and economic relationships and estimate the changes in agricultural production, income, employment and resource demands from proposed 'best management practices.' OVERVIEW OF NITROGEN IN IRRIGATED AGRICULTURE,
California Univ., Davis. Cooperative Extension.
R. S. Rauschkolb.
In: National Conference on Management of Nitrogen in Irrigated Agriculture, p 53-60, 1978. 3 ref.

Descriptors: Water quality, *Nitrogen, *Pollution abatement, Pollutant identification, Fertilization, Water management(Applied), *Irrigated land, Water law.

Events of the recent past have been moving agriculture rapidly towards the point where it can no longer afford the luxury of being concerned with production of food and fiber alone. One of the principle reasons for the change in attitudes has been the Federal Water Pollution Control Act Amendment of 1972, commonly referred to as Public Law 92-500. Within this law there is a section dealing with areawide planning, Section 208. Under this section each state is to develop waste water management strategies which indicate methods for control or treatment of all point and nonpoint sources of pollution within an area. Specific outputs resulting from Section 208 area-wide planning include a regulatory program to control or treat all point and nonpoint pollution sources, including in-place or accumulated pollution sources. This represents only one of the many outputs that are expected from area 208 planning, but it is one that seems to be the most important with respect to nitrogen management in irrigated agriculture. POLLUTION CONTROL GUIDELINES FOR COAL REFUSE PILES AND SLURRY PONDS.
Wahler (W. A.) and Associates, Palo Alto, CA.
Report No. EPA-600/7-78-222, November 1978. 223 p, 66 fig, 49 tab, 24 ref, 2 append. 68-03-2344, 68-03-2431.

Descriptors: *Coal mine wastes, *Waste disposal, *Water pollution sources, *Reclamation, *Pollution abatement, Water pollution control, Mine acids, Settling basins, Waste dilution, Sediment transport, Sediment discharge, Sediment load, Vegetation effects, Publications, Technology, Sampling.

A study undertaken to develop guidelines for construction, operation, and reclamation of coal refuse piles and slurry ponds is reported. Detailed air and water quality sampling programs were carried out at eight active refuse pile sites and six slurry pond sites in the eastern coal-mining regions. Information is presented on: pollution mechanism; the physical and chemical properties of coal refuse; coal preparation plant processes and procedure; site selection; conveyance systems for transporting refuse from plant to disposal area; and site abandonment and reclamation. Alternative techniques for refuse disposal and pollution control applicable to specific situations are discussed. It was generally concluded from the literature search, interviews and the field study program that technology is currently available for the construction of refuse disposal and reclamation facilities which can operate in an environmentally acceptable manner. (Davison-IPA)

SOURCE ASSESSMENT: OPEN MINING OF COAL, STATE OF THE ART,
Monsanto Research Corp., Dayton, OH.
S. J. Rusek, S. R. Archer, R. A. Wachter, and T. R. Blackwood.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-288 497. Price codes: A06 in paper copy, A01 in microfiche.

Report No. EPA-600/2-78-004X, September 1978. 86 p, 11 fig, 10 tab, 59 ref, 3 append. 68-02-1874.

Descriptors: *Air pollution, *Coal mines, *Pollution abatement, *Reviews, *Strip mines, Air pollution effects, Hazards, Pollutant identification, Drilling equipment, Overburden, Wind erosion, Dusts, Safety.

The potential environmental effects of atmospheric emissions from the open mining of coal are evaluated using source severity values. In open coal mining there are seven unit operations or subprocesses involving excavation of overburden, removal of the coal, and coal transport. The only hazardous emissions are respirable dusts which are generated by five of the subprocesses and wind erosion. Total dust loading from these sources are: coal transport and unloading, 40%; blasting, 30%; coal loading, 14%; drilling, 12%; coal augering, 1%; and wind erosion, 3%. The emission factors for the unit operations indicate that 13 g of respirable dust are emitted per metric ton of coal mined. Control technology has been effected for drill rigs, haul roads and coal refuse piles. Cyclones and water sprays are employed on the larger drills to control particulates. Water spraying of haul roads for dust reduction and safety is enforced by most states. Gaseous pollutants from stagnant coal piles are controlled by shielding the piles from the wind, applying cooling process, or removing the carbonaceous material. Currently the open coal mining industry has a growth rate of 3.5%/year; the growth factor for the industry is 1.23. (Davison-IPA)

Battelle Columbus Labds., OH.
S. T. DiNovo, W. E. Ballantyne, L. M. Curran, W. C. Baytos, and K. M. Duke.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 775, Price codes: A16 in paper copy, A01 in microfiche. Report No EPA-600/7-78-204, October 1978. 363 p, 70 fig, 121 tab, 261 ref. 68-02-1323.

Descriptors: *Biomass, *Fuels, *Municipal wastes, Aquaculture, Forestry, Hydrogenation, Hydrolysis, Environmental effects, Forest management, Energy conversion, Biochemistry, Agricultural wastes.

The technological aspects of biomass production and conversion and their associated environmental effects are examined. Details of five categories are given: (1) agricultural and forestry wastes; (2) aquaculture; (3) silviculture; (4) energy crops; and (5) urban and industrial wastes. The primary thermochemical processes reviewed in detail include direct conversion, pyrolysis, and acid hydrolysis, and the lesser developed technologies, hydrogenation and naval stores are briefly analyzed. The primary biochemical processes, anaerobic digestion and enzymatic hydrolysis, are detailed, and the secondary processes, methanol and other Fisher-Tropschtype products from synthesis gas, ethanol production from sugar solutions, and other minor process systems, are evaluated. A series of six regionalized scenarios which examine the environmental implications of different conversion technologies applicable to different geographical areas of the U.S. are presented. It is concluded that the development of biomass sources of synthetic fuels could potentially satisfy 3 to 8% of the projected U.S. energy demand by the turn of the century. However, the development of biomass sources should be in concert with localized energy needs. It is also concluded that since the development of biomass converson is in the early stages of development, technology and environmental protection can develop simultaneously. (Davison-IPA)

LINERS FOR SANITARY LANDFILLS AND CHEMICAL AND HAZARDOUS WASTE DISPOSAL SITES,
Ebon Research Systems, Silver Spring, MD.
S. A. Ware, and G. S. Jackson.
Report No. EPA-600/9-78-005, May 1978. 92 p, 9 fig, 17 tab, 22 ref, 2 append. 68-03-2460-4.

Descriptors: *Landfills, *Linings, *Sewage lagoons, *Waste storage, Waste dumps, Chemical wastes, Municipal wastes, Hazardous wastes, Plastic films, Solid wastes, Holding ponds, Waste disposal, Ponds, Inhibitors.

Sanitary landfills, chemical and hazardous waste disposal sites, and holding ponds with an impermeable lining are identified, listed, and briefly described. The term 'liner' is defined as a variety of materials that can be installed at the base and around the perimeter of a sanitary landfill to prevent leachate from entering ground and surface waters and to impede migration of gases across the fill before venting to the atmosphere. Liners listed include polyethylene, chlorinated polyethylene, polyvinyl chloride, Hypalon R, ethylene propylene diene monomer, butyl rubber, conventional paving asphalt, hot sprayed asphalt, asphalt-sealed fabric, concrete and various treated and untreated soil mixtures, such as compacted clay, pure montmorillonite and montmorillonite mixed with concrete. Three methods are evaluated for excavating a fill to retrieve a small portion of liner for laboratory analysis: use of the dragline, the back hoe, and the caisson. Costs for each of the methods are given. (Davison-IPA)

Department of the Environment, Vancouver (British Columbia). Inland Waters Directorate (Pacific Region).
S. W. Sheehan, and S. O. Russell.
Water Resources Research, Vol. 14, No. 5, p. 976-980, October 1978. 4 fig, 2 tab, 14 ref.

Descriptors: *Salmon, *Management, *Spawning, *Skeena River fishery(BC), Canada, Real time, Forecasting, Probability, Equations, Mathematical models, Systems analysis, *Bayesian decision theory, Utility curve, Escapement, Renewable resources.

Bayesian decision theory provides concepts that seem ideally suited to many renewable resource management problems. A procedure for applying the concepts to salmon management in real time is illustrated with an example from the Skeena River fishery in Northern British Columbia, Canada. The decision in question is the escapement to allow for spawning purposes in a particular year. The procedure involves determining a probabilistic relationship between the escapement in one year and the number of adults returning in the cycle year 4 years later, defining a utility curve for the catch, forecasting the number of salmon expected to return in the current year, and computing the escapement with the maximum expected utility. Discussion indicates areas where further work is needed and also other possible applications of the procedure. (Bell-Cornell)

Available from University Microfilms International, Ann Arbor, MI 48106: Ph.D. Thesis, 1977. 255 p. 69 fig, 14 tab, 47 refs, 4 append. OWRT B-095-WIS(2) 14-34-0001-6133.

Descriptors: *Alternative costs, *Cost analysis, *Econometrics, *Economic impact, *Estimating, *Forecasting, *Model studies, *Wisconsin, *Milwaukee(Wisc).

Two general hypotheses were posed. The first was that the prototype structure for small area econometric models developed by Glickman (1971) and extended by Hall and Licari (1973) is general enough to be utilized for the Milwaukee regional economy with only slight modifications. The second hypothesis was that a regional econometric model having greater disaggregation and a structure developed in accordance with theoretical relationships would produce more reliable simulation and forecasting results than the more aggregated model. The model was developed with minor modifications designed to provide a better fit to the Milwaukee regional economy. This aggregate model, as did the Philadelphia prototype, contained four manufacturing and non-manufacturing sectors; equations are presented for output, employment, and wages, and a series of relationships for the derivation of such regional aggregate variables as Gross Regional Product, total employment, unemployment rate, income, population, consumer prices, government revenues and government expenditures. The results of the ex post (sample period) forecasts, as measured by mean absolute percent error, indicated that this aggregate model generally succeeded in simulating values of the actual data to a degree superior to that of the Philadelphia prototype. A comparison of the ex post forecasts of the Milwaukee model with those of the Los Angeles model reveals that the former more accurately simulates regional business cycles. From the results, it can be concluded that the aggregate Milwaukee econometric model provides a successful test of the generality of Glickman's Philadelphia prototype for small area econometric modeling.

ECOSYSTEM CHARACTERIZATION-AN APPROACH TO COASTAL PLANNING AND MANAGEMENT,
Fish and Wildlife Service, Washington, DC. Office of Biological Services.
A. W. Palmisano.
In: Contributed Papers on Coastal Ecological Characterization, Fourth Biennial International Estuarine Research Federation Conference, October, 1977. U. S. Fish and Wildlife Service, Office of Biological Servies, FWS/IBS-77/37, p 4-9, April, 1978. 4 fig.

Descriptors: *Coasts, *Ecosystems, *Systems analysis, Coastal plains, Structural models, Estuaries, Structure, Ecology, Land management, Simulation analysis.

The ecosystem characterization approach involves the delineation of the physical boundaries of the system, preparation of a functional conceptual ecosystem model, synthesis and analysis of existing information using the model as a blueprint, and the preparation of an interim pilot characterization report. The latter report, after review by the user group, will permit the effective production of the final ecosystem characterization report. During the process most of the relevant information about the system will be brought together in a data source appendix. Guidance throughout the project is provided by the user committee to assure that the information will meet action program needs. Ecosystem characterizations can provide an important ecological foundation from which to plan and manage out natural resources. (See also W79-03697)(Steiner-Mass)

USER-ORIENTED CONCEPTUAL MODELING IN THE ECOLOGICAL CHARACTERIZATION OF THE SEA ISLANDS AND COASTAL PLAIN OF SOUTH CAROLINA AND GEORGIA,
South Carolina Wildlife and Marine Resources Dept., Charleston. Marine Resources Research Inst.
J. J. Manzi, and R. J. Reimold.
In: Contributed Papers on Coastal Ecological Characterization Studies, Fourth Biennial International Estuarine Research Federation Conference, October, 1977. U. S. Fish and Wildlife Service, Office of Biological Sciences, FWS/OBS-77/37, p. 19-31. 9 fig, 10 ref.

Descriptors: *Model studies, *Systems analysis, Estuaries, *Design, Coasts, Coastal plains, Ecology, Ecosystems, Simulation analysis, Evaluation, Design, Testing, Analysis, Wetlands, Coastal marshes, Swamps, *South Carolina, *Georgia.

A user-oriented system of access is presented that produces information as well as an ecological understanding of the various habitats comprising the study area. The system is composed of four major parts: an executive summary, models, habitat distribution of various species, and interaction matrices. The executive summary will provide an introduction to characterization concepts, a brief summary of the ecosystems, and instructions for data search and retrieval. Models are included to present the principal components of each ecosystem and their relationships. The four models compiled for the test area are: the marine subtidal system, the estuarine intertidal emergent wetland system, the riverine forested wetland system, and the upland pine forest system. The models are presented in a diagrammatic (energese) and a pictorial mode. The ecological sketches are brief narratives on high priority species, and summarize their reproductive and cover requirements, and impinging human activities. Finally, the interaction matrices will form the central component of the user system package Each ecosystem will be supported by a single matrix which cross-references common environmental alterations with existing environmental characteristics. Each intersection of the matrix will thus privide appropriate entry into the characterization products. (See also W79-03697) (Steiner-Mass)

ALLOCATIONAL INEFFICIENCY OF BENEFIT/COST APPLIED TO WATER AND SEWERAGE SUPPLY: INTERACTIONS BETWEEN TIME-SERIES AND CROSS-SECTIONAL MODELS,
Pennsylvania State Univ., University Park. Dept. of Economics.
S. P. Coelen, R. W. Bahl, and J. J. Warford.
Water Supply and Management, Vol. 2, No. 3, p. 265-274, 1978. 1 fig, 3 tab, 11 ref, 13 ref.

Descriptors: *Water supply, *Sewerage, *Cost-benefit analysis, *Time series analysis, *Measurement, Methodology, Data collections, Investment, Effects, Equations, Mathematical models, System analysis, Property values, Empirical analysis, Environmental analysis, Cross-section data, Developing countries.

A fundamental problem of cost-benefit analysis is that benefit measurement is often difficult or impossible. These difficulties vary considerably between sectors, and thus estimated economic rates of return may allocate funds inefficiently across the sectors. Within the sectors, water supply and sewerage projects fare badly due to systematic underestimation. The central premise of this analysis is that unpaid-for benefits from investments in public sewerage and water facilities are reflected in increased land values. The basic theory of this paper is taken from earlier work, especially from Lind (1974) and Rosen (1974), which is extended here to show that (1) the land value approach is particularly applicable in the developing countries, (2) time-series techniques are as useful for measuring land value increments as the more traditional cross-sectional methods, and (3) water/sewerage projects do, in fact, have an impact on property Results obtained from using this modeling technique in a case study of Nairobi, Kenya are presented.

METHODS FOR EVALUATING NON-MARKET IMPACTS IN POLICY DECISIONS WITH SPECIAL REFERENCE TO WATER RESOURCES DEVELOPMENT PROJECTS,
Maryland Univ., College Park
K. Finsterbusch
IWR Contract Report 77-8, U S Army Engineer Institute for Water Resources, Fort Belvoir, Virginia, December 1977 46 p, 4 fig, 2 tab, 64 ref

Descriptors: *Water resources development, *Projects, *Evaluation, *Non-market impacts, Decision making, Planning, Feasibility, Cost-benefit analy-

sis. Political aspects. River basins. Methodology. Water policy. Social impact. Comparative measurement. Goal programming. Weighting procedure. Systems analysis

Explored is the as yet intractable problem of accounting for non-market impacts in policy decisions, especially in the context of water resource development projects. The first section presents and critiques in general terms 19 methods. Included are common metrics, weighting schemes, discrete dimensions evaluation, methods utilizing public or political evaluations, and methods which obviate evaluation. In the second section, the social impacts of water resource projects are reviewed and related to the 19 valuation methods. In the final section, a number of critical issues involved in valuing non-market impacts are discussed, considering: priority of social criteria over engineering-economic criteria, the principle of justice; selection versus elimination; the human limits to evaluations, and building cummulation into evaluations through rationalized weights. WATER-RESOURCE SYSTEMS PLANNING.
Geological Survey, Reston, VA.
N C Matalas, and M B Fiering
In: Climate, Climatic Change, and Water Supply. Studies in Geophysics, National Academy of Sciences, Washington, D C., p 99-110, 1977 (The National Research Council) 9 fig, 23 ref

Descriptors: *Water resources, *Planning, *Design, *Climatic change, *Economic regret, *Robustness, Forecasting, Calculus, Hydrologic systems, Optimization, Systems analysis, Mathematical models, Probability, Uncertainty, Regret minimization

Discussed is the calculus of economic regrets in water-resource design in light of possible procedural changes that could result from considering forecasts of climatic changes. It is emphasized that unless the exact sequence of future flows can be predicted with certainty, there may be little benefit to hydrologic system design of even an exact forecast of a change in one or more of the parameter values of the hydrologic input. To allow explicitly for climatic change in the design process, the concept of 'robustness' is introduced: A robust design may be optimal in the classical sense, but it will be a design which performs reasonably well under a variety of possible climates. The 'resilience' of an existing well-buffered water-resource system can be enhanced by changes in insurance, subsidies, zoning, water law, and price structures, as well as by additional structural measures, such as reservoirs or pipelines. Prolonged droughts could enhance conflicts between groups of water users. Referring to the Paretian frontier, it is hoped that resolution of such conflicts would be rational, with resulting tradeoffs acceptable to all. (See also W79-03527) (Bell-Graf-Cornell)

URBAN RUNOFF CONTROL MASTER PLANNING.
American Society of Civil Engineers, Marblehead, MA. Urban Water Resources Research Program.
M B McPherson
Journal of the Water Resources Planning and Management Division, Proceedings of American Society of Civil Engineers, Vol. 104, No. WR1, p. 223-234, November 1978. 4 fig, 49 ref

Descriptors: *Urban runoff, *Planning, *Land use, *Flood control, *Drainage, *Water balance, *Water pollution, *Economic analysis, *Models, Management, Costs, Cost-benefit analysis, Water resources, Control, Master plans, Public works, Systems analysis

The thesis of this paper is that rational planning requires conjunctive consideration of the quantity and quality aspects of urban runoff within a comprehensive, multiple-use framework. Explored are some of the more obvious arguments with reference to land-use factors, economic evaluations, flood control considerations, performance simulation, and metropolitan water resource inventories. There appear to be very few master plans extant that have integrated water quantity management with water quality management. Given the institutional constraints in metropolitan areas, perhaps the most that can be expected is adoption of an integrated, comprehensive, or systems approach to urban runoff planning. However, such an approach is subtle in a documentary sense, and more rational conjunctive master planning may be in progress than external indications seem to imply. (Bell-Cornell)

DELAWARE RIVER BASIN WATER RESOURCES MANAGEMENT.
Delaware River Basin Commission, Trenton, NJ
C. H. J. Hull
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 104, No WR1, p 157-174, November 1978. 2 fig, 4 tab, 35 ref

Descriptors: *Delaware River, *Flood control, *Water resources, *Water supply, *Water management(Applied), *Salinity, Planning, Estuaries, Water quality, Rivers, Water pollution, Multiple purpose, Delaware River Basin Commission, Tocks Island Lake project

The Comprehensive Plan (CP) for multipurpose development and management of water resources in the Delaware River Basin, under the first Federal-Interstate compact, is explained. The CP is a codification of administrative laws adopted by the Delaware River Basin Commission, and serves as a general guide for planning, development, and operation of water-related projects and facilities, both public and private, for water supply, water quality control, flood control, hydroelectric power generation, and recreation. The CP serves also a regulatory document to prohibit developments that do not conform to the adopted plan. The CP grows in scope almost monthly as the Commission adds new projects, policies, criteria, and standards. The CP, together with the basic statutory law, the Delaware River Basin Compact, provide the legal basis for regulatory control of water resources in the four-state, 13,000 square mile region. The CP includes the controversial Tocks Island Lake project, a multipurpose impoundment sited on a 37-mile reach of the Delaware River just downstream of the New York-New Jersey state boundary, which has been halted by opposition from environmental groups. Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 583. Price codes: A03 in paper copy, A01 in microfiche. Water Resources Research Center Purdue University Technical Report No. 106. December 1978. 35 p, 23 tab, 2 ref, 1 append. OWRT C-6106 (5213)(7).

Descriptors: *Water Resources Development, *Urban drainage, *Floodplains, *Ditches, *Social participation, Canals, Conduits, Pipes, Sewers, Subsurface drains, Attitudes, Urban sociology, Institutions, *Urban Water Resources, *Retention basins, *Public participation.

The purpose was to examine the acceptability to community leaders and the general public of selected urban water resources policy alternatives. The orientation is methodological; using the survey method, questions are deliberately varied in generality-specificity, and comparisons are made on the effect of experience with water problems and location of residence (urban, transitional, rural) on acceptability of alternative solutions. Data are from personal interviews with 46 leaders and a sample of 139 other residents of Tippecanoe County, Indiana. Asking more specific questions produced greater indications of concern with the environment and water pollution. Many of the differences between leaders and nonleaders were small; however, some important differences were found. For example, although leaders view themselves as more conservative, they were more liberal on some policy issues, e.g., willingness to pay more to combat water pollution and a firm policy to prevent building in wetlands. Only limited differences were found across residential location with wetlands policy being a specific example of a substantial difference. Respondents expressed considerable concern over two drainage alternatives: retention basins and open ditches, whether they had direct experience with them or not. They also expressed a strong belief in citizen participation and a preference for local government involvement in policy decisions.

INTERREGIONAL IMPACTS OF ALTERNATIVE WATER POLICIES FOR IRRIGATION IN THE WESTERN UNITED STATES: A QUANTITATIVE ASSESSMENT.
Wisconsin Univ.-Madison. Dept. of Agricultural Economics.
N L Meyer
Available from the National Technical Information Service, Springfield, VA. 22161 as PB-290 667. Price codes: A10 in paper copy, A01 in microfiche. Ph.D. Thesis, 1974. 191 p, 10 fig, 15 tab, 57 ref, append. OWRT B-057-WIS(5), 14-31-0001-3354.

Descriptors: *Regional economics, *Regional development, Water resources development, *Water distribution, *Farm management, *Crop production, *Sweet potatoes, *Transportation, *Alternative planning, *Water policy

An evaluation framework was developed which permits measuring the interregional effects that would result from water resource projects in the West. Further, the framework facilitates identification of intraregional shifts associated with project induced interregional impacts. Impacts of four water policies were considered. Alternative water policies are: (1) continue present policy, (2) cease new construction and honor existing contracts on present projects, (3) build new water projects only if they can repay the cost of delivering water for both new and existing projects. Each policy change was evaluated by region with respect to changes in acreage, total revenue, farm revenue, processing revenue, and transportation revenue. Aggregate changes in farm, processing and transportation revenues were also shown. Fall potatoes were used as a vehicle for the analysis. Continuing present water policy would encourage expansion of acreage in areas utilizing subsidized water. Production would remain constant or decline in higher cost production areas. Continuing present pricing policies on existing projects and ceasing construction of new projects implies expanded production would have to be through technical change in water use or through increased acreage in regions not dependent on publicly subsidized water.

SUBJECTIVE ESTIMATION OF VARIABILITY,
Arizona Univ., Tucson. Dept. of Systems and Industrial Engineering.
R. L. Fike.
Available from the National Technical Information Service, Springfield, VA. 22161 as PB-290 680, Price codes: A08 in paper copy, A01 in microfiche. Ph.D. Dissertation, 1977. 147p, 14 fig, 14 tab, bibliography, 3 append. OWRT B-043-ARIZ(26), 14-31-0001-5056.

Descriptors: *Attitudes, *Human behavior, Estimating, *Human perception, *Variability, *Estimate combination, Sample information.

Experimental research concerning perception and estimation of variability and the combination of variability estimates is reported. People's ability to perceive variability, as shown by their ability to make correct discrimination judgments among small visually presented samples drawn from populations with the same mean but with different variances, is nearly optimal. Experiments are reported which show that people are able to encode their perception of variability into quantitative estimates which are fairly accurate. The commonly reported 'hypercertainty' phenomenon, extreme overconfidence of underestimation of the variability, is found to be associated primarily with a complete lack of sample information on which the estimates can be based (e.g., almanac-type variables). A model of human performance, which is substantially different from the mathematically correct one, is proposed for tasks involving estimation of composite variability based on data about the component variables. It is concluded that, contrary to the indications of prior work, people are potentially able to perceive and estimate variability fairly accurately, especially if they have even a small amount of sample information.

COMBATING PHEASANT LOSSES IN THE COLUMBIA BASIN - WHERE DO WE GO FROM HERE,
Washington State Univ., Pullman. Dept. of Agricultural Economics.
S. C. Matulich, and B. F. Wolfley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 608, Price codes: A02 in paper copy, A01 in microfiche. OWRT C-7165 (No. 6213)(3), 14-31-0001-6213.

Descriptors: *Irrigation projects, *Washington, *Pheasants, Recreation, Planning, *Columbia River Basin(Wash), Economic analysis, Cost analysis, *Income.

In the absence of apparent legal obligations which bind existing Columbia Basin irrigators to deliberately allocate resources toward pheasant production, provision of economic incentives is necessary to change the status of pheasant from an unintentional production alternative. The amount and type of resources farmers will voluntarily divert from cropping activities depends upon the economic incentives for wildlife production relative to other production possibilities. In the context of non-market goods such as pheasant (which are not bought and sold in the market place), incentives must equal or exceed the opportunity cost of their production. That is, incentives (compensation) required to shift resources to pheasant production must be at least equal to the income foregone from crop production. Provision of such incentives is justified if the benefits from additional pheasant equal or exceed the foregone farm income.

PHEASANT ENHANCEMENT POTENTIALS IN IRRIGATED AGRICULTURE: A CASE STUDY OF THE COLUMBIA BASIN,
Washington State Univ., Pullman. Dept. of Agricultural Economics.
G. H. Bagwell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 556, Price codes: A06 in paper copy, A01 in microfiche. MA Thesis, 1978. 104 p, 14 tab, 37 ref, 4 append. OWRT C-7165 (No 6213)(4), 14-31-0001-6213.

Descriptors: *Pheasants, Irrigated agriculture, Wildlife managers, *Washington, *Columbia River basin(Wash), Management, Economic feasibility, Alternative costs.

Declining pheasant populations within irrigated agriculture have alarmed wildlife managers who began identifying methods of stabilizing and enhancing the pheasant population. The fundamental problem is that of allocating scarce resources between agriculture and wildlife. The overall objective of this study was to determine the opportunity costs of alternative pheasant enhancement practices, and to examine their potential economic feasibility within irrigated agriculture. Typical Columbia Basin farm operations were modeled into enterprise base budgets. Whoel farm costs and returns were estimated when enterprise budgets were aggregated by rotation to the farm level. Comparison of foregone income with pheasant response estimates provided an opportunity cost per bird. Analysis of alternative pheasant enhancement practices revealed a large deviation in opportunity costs per bird. Permanent cover crops in the form of strips and small-sized farms were found to provide least-cost enhancement. Generally, enhancement practices which generate large pheasant responses were associated with substantially higher per pheasant opportunity costs than low bird response enhancement practices. Comparison of the least cost enhancement practices with current Game Department costs of pen raising and releasing pheasants, and in consideration of additional values gained from establishing permanent habitat, pheasant enhancement in irrigated agriculture appears potentially feasible. Successful enhancement, however, is contingent upon farmers being compensated for lost income. Wildlife managers should direct enhancement strategies toward lower valued crops and smal farms liberalization of hunting regulations in enhanced areas; public access to enhanced areas must be assured.

A STUDY OF INTERESTED AND ACTIVE PARTIES CONCERNED WITH WATER RESOURCE MANAGEMENT IN WASHINGTON STATE: IMPLICATIONS FOR A MANAGEMENT SYSTEMS MODEL,
Washington State Univ., Pullman. Dept. of Political Science.
B. A. Haines.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 665, Price codes: A07 in paper copy, A01 in microfiche. Masters Thesis, 1978. 133 p, 3 fig, 17 tab, 24 ref, 9 append. OWRT A-090-WASH(2).

Descriptors: *Administration, *Management, *Washington, *Planning, *Water resources, Decision making, Water resources development, Water conservation, Water policy, Water utilization, State governments, Regional development, Human population, Systems analysis.

In response to a legislative mandate calling for public participation in water resource management in Washington State, a hypothetical management model was developed. The background of current policy decisions includes past and present statutory law, administrative regulations, and literature on the concept of beneficial use of water. Major factors considered in developing this model included: the present tax payer revolt seeking a reduction in government spending; increasing pressure for new uses/users of this resource which has finite, but unpredictable limits; and pressures from different users to establish theirs as the most important use. A management system utilizing non-governmental entities to develop and administer programs directed toward conservation, especially reducing waste, would address these problems. The management system is described and accompanied by a flow chart of its physical structure. To determine the potential usefulness of this model, data derived from questionnaire responses of governmental and non-governmental people interested and involved in water resources administration were used. The population study and its findings are reported. Conclusions relating to the validity of the model and further research recommendations are presented. (Davison-IPA)

AN ECONOMIC ANALYSIS OF PRICING RESIDENTIAL WATER SUPPLIES IN PUERTO RICO,
Puerto Rico Univ., Mayaguez. School of Engineering.
R. Ramgolam, and H. Sahai.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 564, Price codes: A07 in paper copy, A01 in microfiche. Water Resources Research Institute, University of Puerto Rico, Completion Report December 1977. 122 p, 5 fig, 16 tab, 26 ref. OWRT A-047-PR(1).

Descriptors: *Water allocation(Policy), *Puerto, *Water rates, *Cost analysis, Discriminatory pricing, Water users, Water loss, Puerto Rico Aqueduct and Sewer Authority, Domestic water, Water policy.

A study of water pricing in Puerto Rico was conducted: (1) to examine the application of price theory in the allotment of residential water; (2) to determine which factors affect the price of water used in the residential areas; (3) to investigate and evaluate the existing price structure and pricing policy of residential water; and (4) examine water pricing policies based on economic criteria and provide recommendations for efficient water allocation to Puerto Rican residents. The Puerto Rico Aqueduct and Sewer Authority (PRASA) is a monopoly and a semi-autonomous agency of the Puerto Rican government which provides residential water service to all of Puerto Rico. Present rates are metered, based on a five block schedule applicable to all customer classes; the rates increase in the first two blocks and then decline. The rates were found discriminatory because of a higher charge to residential customers, with the highest charge to the middle class. A regression analysis indicated the following four variables significant in determining water rates: (1) number of customers served, (2) water loss, (3) net debt, and (4) government subsidies. It is recommended that charges for water service be equal to marginal production costs supplemented by a service charge equal to the difference between the average and marginal production costs. EVALUATION OF METHODOLOGY USED IN ECOLOGICAL CHARACTERIZATION OF THE CHENIER PLAIN,
National Coastal Ecosystems Team, NSTL Station, MS.
R. H. Chabreck, J. B. Johnston, and J. B. Kirkwood.
In: Contributed Papers on Coastal Ecological Characterization Studies, Fourth Biennial International Estuarine Research Federation Conference October, 1977. U. S. Fish and Wildlife Service, Office of Biological Services, FWS/OBS-77/37, p. 10-14, April, 1978. 3 tab.

Descriptors: *Evaluation, *Systems analysis, *Ecosystems, *Coasts, Coastal plains, Ecology, Land management, Simulation analysis, Design, Testing, Analysis.

The Chenier Plain, Texas-Louisiana, ecosystem characterization was the first investigation of this type to be initiated so that an important aspect of the project was an evaluation of the methodology used. This evaluation was needed also for the orderly execution of subsequent characterizations of other coastal ecosystems. A methodology evaluation made it possible to identify techniques which effectively served to meet project objectives, and at the same time it identified procedures that had not contributed significantly. Aspects of the characterization methodology evaluated include the steering committee concept, user needs survey, conceptual modeling, area delineation, type of mapping, data seach and presentations and pilot study. The results of the evaluations are given and the paper suggests alternative procedures where unsatisfactory results were obtained. (See also W79-03697) (Steiner-Mass)

MANAGEMENT OF SALINE WATER,
California Univ., Davis. Dept. of Agricultural Economics.
C. V. Moore, and J. H. Snyder.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 784, Price codes: A03 in paper copy, A01 in microfiche. Report No. 29, Water Resources Center, Univ of Calif, Davis, Mar 1974. 20 p, 6 fig. (California Water Resources Center Project UCAL-WRC-W-244). OWRT B-147-CAL(2), B-136-CAL(3), B-120-CAL(4), B-094-CAL(5).

Descriptors: *Economics, *Management, *Saline water, *Colorado River basin, *Salinity, Mexico, International waters, Withdrawal, *Irrigation efficiency, *California, *Imperial Valley(Calif), *Orange County(Calif), *Salton Sea(Calif).

Recent research on the economics of saline water management was surveyed and principal conclusions summarized. Salinity studies in the Colorado River Basin, Imperial Valley, Orange County (California), and Salton Sea were examined. Effects of agriculture on quantity and quality of water, methods of increasing irrigation efficiency, salinity in urban and recreational water uses, international and legal aspects of salinity, and cost-sharing in salinity control are discussed. Salinity in a river basin tends to increase from the headwaters to the mouth. The saline waters of the Colorado River pose major management problems in the regions studied, and are also important in relations with Mexico. Total water withdrawals exceed annual replenishments, and total dissolved salinity in the lower reaches of the river are near or beyond threshold uses. Estimated economic losses to domestic users are about $16 million and are projected to increase to a possible level of about $28 million by 1980.

California Univ., Riverside.
E. M. Lofting, and H. C. Davis
In: Climate, Climatic Change, and Water Supply. Studies in Geophysics, National Academy of Sciences, Washington, D.C., p. 49-69, 1977. 11 fig, 14 tab, 70 ref.

Descriptors: *Water resources, *Long-term planning, *Water demand, *Forecasting, *Economic uncertainty, Estimating, Effects, Water utilization, Water requirements, Annual, Land use, Mathematical models, Systems analysis, Linear programming, Climatic variability, Water withdrawal.

Considered are the problems of estimating and forecasting water demands or requirements for the water-use categories of irrigation, commercial, municipal (residential), minerals industries, manufacturing industries, and thermoelectric power. Noted are three new sources of economic uncertainty which make forecasts of future water demand particularly problematic: (1) the enactment of Public Law 22-500; (2) a large increase in irrigated agriculture; and (3) the threat of climatic change. Water-resource systems planning and the role of water-use data in the development of water-use forecasts are discussed. Considered is the interregional linear programming model developed by Heady which yields the least-cost distribution of agricultural production by crop type and geographic region. Next the possible impacts of climatic variability are discussed. The paper concludes with a graphical comparison of existing water-use forecasts to the years 2000-2020, with the results of a simple forecasting model constructed by the authors. FEDERAL COMPLIANCE WITH STATE POLLUTION CONTROL REQUIREMENTS - CALIFORNIA V. ENVIRONMENTAL PROTECTION AGENCY, 511 F. 2D 963 (9TH CIR. 1975),
Wyoming Univ., Laramie. Coll. of Law
B J Trautwein
Land and Water Law Review, Vol. XI, No. 1, p. 147-157, 1976. OWRT-A-003-WYO(5), 14-31-0001-5051.

Descriptors: *Water law, Water pollution control, Water right, Federal Water Pollution Control Act, Jurisdiction.

This case note addresses the subject whether federal installations and agencies must comply with state substantive and procedural requirements with respect to water pollution. The court in deciding the case addressed the issues whether Congress waived exclusive jurisdiction over water pollution in a manner that was not unduly broad and whether the waiver was made in a clear and unequivocal manner. The court reached the decision that the 1972 Federal Water Pollution Control Act mandated federal compliance with state procedural requirements respecting water pollution control. The rationale for this result was that the 1972 Act gave the states the right to regulate water pollution by permit system and that federal compliance with the permit system was the only effective method insuring federal compliance with substantive state water pollution standards.

NWS'S FLASH FLOOD WARNING AND DISASTER PREPAREDNESS PROGRAMS,
National Weather Service, Silver Spring, MD. Disaster Preparedness Staff.
H. M. Mogil, J. C. Monro, and H. S. Groper.
Bulletin of the American Meteorological Society, Vol 59, No 6, p 690-699, June 1978. 8 fig, 53 ref.

Descriptors: *Flash floods, *Warning systems, *Forecasting, *Planning, Disasters, Floods, Excessive precipitation, Precipitation(Atmospheric), Rainfall, Thunderstorms, Tropical storms, Hazards, Flood plains, Radar, Communication, Weather, Meteorology.

Flash floods have become the nation's number one stormy weather killer in the 1970s. Deaths from flash floods are now approaching 200 each year compared to an average of less than 70 per year during the preceding 30-year period. Losses from flash floods are now nearly 10 times what they were in the 1940s. To combat these escalating losses, the National Weather Service (NWS) is expanding its efforts to improve forecasting and warning of flash floods and to improve the public's response to flash flood threats. This paper summarized the present and planned NWS operational flash flood warning and disaster preparedness programs. (Sims-ISWS)

ENVIRONMENTAL SPECIALISTS IN WATER AGENCIES,
Stanford Univ., CA. Dept. of Civil Engineering.
J. R. Jenkins, and L. Ortolano.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol. 104, No. WR1, p. 61-74, November 1978. 1 fig, 1 tab.

Descriptors: *Water resources, *Management, *Government agencies, *Personnel, *Environmental impact statements, Civil engineers, Organization theory, Reports, Water plans.

There are five different roles that environmental specialists can play in water resource agencies: (1) environmental planning; (2) environmental design; (3) system monitoring; (4) report preparation; and (5) report review. Placement of environmental specialists in 'line units' (e.g., planning, design, and maintenance) facilitates coordination. There are, however, significant advantages, in terms of report preparation and review, of keeping environmental specialists in one organization unit and not diffusing them into various units. But with a separate 'staff unit' for environmental specialists, these specialists haveless influence on planning and decision making. Numerous aspects of this dilema are explored using data for the Santa Clara Valley Water District in California and several District Offices of the U.S. Army Corps of Engineers. In the final analysis, the organization arrangement that is in some sense best depends on which of the several roles played by the environmental specialists is to receive emphasis. (Bell-Cornell)

PUBLIC PROCESS PORTION OF IMPACTS ANALYSIS,
Parsons, Brinckerhoff, Quade and Douglas, Inc., Vienna, VA.
F. W. Montanari.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 104, No WR1, p 123-128, November 1978. 2 fig.

Descriptors: *Water resources, *Management, *Social participation, *Environmental impact statements, Water plans, Projects, NEPA, Public process, Anatomy of delay.

With over 8 years of experience with NEPA and public participation in environmental analysis, there is a need to evaluate the cost of the process as compared with the benefits achieved in the actual projects. Frequently, opponents to the actions have sought only to destroy the projects, not to contribute to providing needed services to society. The implications of the public portion of the environmental planning and management with and without public participation are described. An anatomy of delay cites an actual case history of extreme frustration and costly delay in clearing a needed, well-planned, and environmentally-sound project. A post audit to evaluate the results of the process to make NEPA operate efficiently is recommended. (Bell-Cornell)

THE CIVIL ENGINEER'S RESPONSIBILITY IN IMPACT ANALYSIS.
American Society of Civil Engineers, New York. Committee on Impact Analysis of the Water Resources Planning.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers. Vol 104, No WR1, p 253-263, November 1978. 6 ref, 8 append.

Descriptors: *Environmental effects, *Water resources, *Environmental factors, *Environmental impact statements, Natural resources, Planning.

Ways are suggested for engineers and others to make environmental impact analysis more effective by giving specific consideration to the following points: incoporating the analysis as an integral part of the total planning process; recognizing risks in the analysis and decisions; focusing on important issues; recognizing and accounting for the reliability of information; pursuing levels of detail in the analysis consistent with levels in other parts of the planning process and with the importance of the respective issues; making costs of the analysis consistent with other planning costs; and expressing criteria for selection of professional experts and for dealing with nonexpert opinion (insofar as possible eliminating inconsistency of evaluation procedures among various water programs, with the engineer assuming an appropriate role in the public arena, combining EIS with other required environmental documents, and taking adequate time for the analysis.) Descriptors: *Riparian land, *Grazing, *Trees, Effects, Livestock, Southwest U.S., Arizona, New Mexico, Wetlands.

Many streams in Arizona and New Mexico are dependent upon the riparian zone and their associated wetlands for their primary energy source. Continued grazing has eliminated riparian trees in many areas. When this occurs, streams are less confined to their banks and have a more constant sediment load. Fencing out livestock may reduce such damage. (Stihler-Mass)

Riparian habitats may fail to regenerate themselves because of: loss of water flow as a result of diversion, loss of significant portions of entire communities due to floods, high recrational use, phreatophyte control projects, or overgrazing by livestock. A 100-point transect technique for riparian stand analysis is described. Stand composition, crown density, basal area, vigor, and stand structure are taken into account. Management alternatives and objectives are evaluated for environmental consequences. (Stihler-Mass)

THE EFFECTS OF DITCHING A SALT MARSH ON COLONY AND NEST SITE SELECTION BY HERRING GULLS (LARUS ARGENTATUS),
Livingston Coll., New Brunswick, NJ. Dept. of Biology.
J. Burger, and J. Shisler.
The American Midland Naturalist, Vol. 100, No. 1, p. 54-63, July, 1978. 1 fig, 4 tab, 49 ref.

Descriptors: *Salt marshes, *Ditches, *Gulls, *Nesting, *Effects, Nesting cover, Wildlife, Birds, Wetlands, Ecology, Ecological distribution, Life history studies, Habitat, New Jersey.

One-half of Sandy Island, New Jersey, which was ditched with internal ditches connected to the surrounding bay, underwent a major vegetation change as bushes replaced the naturally occurring Spartina over 80 percent of the area. No significant vegetational hanged occurred on the half of the island with only internal ditching, and the population of herring gulls moved to this area. Gulls nested in Spartina patens on spoil piles near bushes. As the highest in the marsh, these areas are less susceptible to storm and flood tides. The gulls nesting on spoils built higher nests, laid bigger eggs, and had a higher mean clutch size than birds that did not nest on spoil piles. Spoil piles are suggested as the preferred habitat of the older, more experienced birds. (Howard-Mass)

Descriptors: Compensation, *Cost allocation, *Economic efficiency, *Equilibrium prices, *Government finance, *Payment, *Pollution taxes(Charges), *Competitive use, Subsidies, Regulations.

Earlier writings by Pigou, Knight, and Coase are examined to show that the problems of pollution may be analyzed more accurately if they are viewed as resulting from conflicting desires to use some presently unpriced asset. Thus, firms want to use water quality for waste disposal, while fishermen want to use it for propagation of fish. In this respect the environment is more nearly like a private good than a public good. A graphical analysis of the value placed on the environment by competing users, both public and private, is presented. Regulations, subsidies, and charges are discussed as means for attaining the optimum use of the environment. They are analyzed separately, and charges are recommended as most likely to produce an economic optimum. However, charges should be bilateral, i.e., levied on both those who wish to discharge wastes and those who wish to limit waste discharge. The government is a logical party to assume ownership where none previously clearly existed and to collect revenues for use of the environment. Funds collected should be assigned to general revenues and not necessarily used for pollution abatement unless the use provides the highest marginal return of all possible government expenditures.

Interim Report No. EPA-600/7-77-120, November 1977. 170 p, 9 fig, 32 tab, 43 ref, 10 append. R804848-01.

Descriptors: *Energy, *Public utilities, *Ohio River Basin, Interstate, Environmental effects, Social aspects, Social participation, Social impact, Public health, Planning, Biology, Economics, Nuclear energy, Fossil fuels, Power plants, Regional analysis, Investigations, Water supply.

An assessment of the potential environmental, social, and economic impacts of proposed powerplants and other energy conversion facilities on a large section of the Ohio River Basin is summarized. The Ohio River Basin Energy Study (ORBES) Phase I was conducted by faculty from six state universities within the study region: all of Kentucky, large parts of Illinois, Indiana, and Ohio. The two basic options, high energy-growth and low energy-growth, were analyzed, and two scenarios were created for each with varying mixes of coal-fired and nuclear-fueled energy conversion facilities. Preliminary findings of Phase I are regional and include information on natural resources, developed resources, the ecological and biological environment, public health, and economic and social factors. Major findings include: (1) air quality limitations in the region are becoming increasingly important considerations; (2) water availability limitations may become important before the year 2000; and (3) a high rate of growth may be associated with an insufficient supply of skilled labor for the construction of conversion facilities. MEASURING SYMBIOTIC NITROGEN FIXATION IN RANGELAND PLOTS OF TRIFOLIUM SUBTERRANEUM L. AND BROMUS MOLLIS L.,
California Univ., Davis. Dept. of Agronomy and Range Science; and California Univ., Davis. Dept of Vegetable Crops.
D. A. Phillips, and J. P. Bennett.
Agronomy Journal, Vol. 70, No. 4, p 671-674, July-August, 1978. 3 fig, 1 tab, 16 ref.

Descriptors: *Nitrogen fixation, *Range grasses, Legumes, Clovers, *Range management, Symbiosis, Isotop studies.

The 15N A-value technique and the acetylene reduction method were compared for their accuracy in determining seasonal symbiotic N2 fixation on a ground area basis in rangeland plots of Trifolium subterraneum L. and Bromus mollis L. To simulate range management practices, seeds were planted at 10, 141, or 1970 seeds/sq m in pure stands or 50:50 mixtures in Laughlin loam, a member of the fine-loamy, mixed, mesic family of Ultic Haploxerolls. Amounts of N2 fixed, calculated by the 15N A-value technique, varied significantly with planting density and proportion of clover at different densities. Seasonal, symbiotic N2 fixation, calculated from the acetylene reduction method, did not vary significantly with either planting density or proportion of clover. It is concluded that with appropriate studies on possible differences in isotope accumulation by a grass and a legume, including morphological, physiological, and bio-chemical differences, the 15N A-value technique should be more quantitative and discriminatory than the acetylene reduction technique. The single seasonal sampling requirement of the 15N A-value technique also is more amenable to the overall goal of determining the effect of range management systems on symbiotic N2 fixation. (Skogerboe-Colorado State)

DEPOLARIZATION OF REFLECTED RADIO SIGNALS,
Z. Klau Dzh
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 42-47, August 1976. 1 fig, 6 ref.

Descriptors: *Radio waves, *Ice, *Ice cover, Remote sensing, Radar, Measurement, Snow, Reflectance, Microwaves, Anisotropy, On-site investigations, Depolarization, Reflected signals, Ice shelf.

Elliptical and linear depolarization of reflected radio signals propagating in a glacier were examined. Elliptical depolarization is usually the result of propagation in an anisotropic medium. Linear depolarization occurs with reflection from a rough surface. Depolarization observed at Skelton glacier in 1966 can be ascribed to both mechanisms. Signals coming from great depths (10 microseconds) depolarize as a result of internal reflections at the South Pole, while signals coming from lesser depths (5 microseconds) are not depolarized. M. A. Kropotkin.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 73-78, August 1976. 2 fig, 9 ref.

Descriptors: *Optical properties, *Water, *Laboratory tests, *Reflectance, Instrumentation, Equipment, Physical properties, Water properties, Spectrometers, Radiation, Infrared radiation, Reflection factor.

An attachment to a standard single-beam infrared spectrometer used to measure spectral reflection factors in the wavelength range from 1 to 20 microns, and a special device to measure reflections in the wavelength zone from 20 to 50 microns were described. The latter consists of a single-beam infrared spectrometer with exchangeable diffraction grids and an optical system which to focus radiation either onto a sample or onto a receiver, located beneath a reflecting hemisphere. A convergent beam with an apex angle of 5 deg fell on the water surface under analysis for all measurements. It was demonstrated that when the reflecting hemisphere in the described apparatus is replaced by a reflecting hemiellipsoid, it can be used to analyze the infrared reflection spectrum of snow and ice. COASTAL ICE DYNAMICS ACCORDING TO SLAR OBSERVATIONS,
S. M. Losev, and Yu. A. Gorbunov
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 102-111, August 1976. 3 fig, 4 tab, 7 ref.

Descriptors: *Remote sensing, *Sea ice, *Radar, *Coasts, Aircraft, Drifting(Aquatic), Islands, Ice cover, Movement, Photography, Aerial photography, Side-looking airborne radar, Ice dynamics, Ice compression, Ice compactness, Drift velocity.

Specific features of the dynamics of ice on polar seas were analyzed on the basis of observations by a side-looking airborne radar set with an observation interval of 2 days. It was established that the effect of islands on movement of compacted ice on the drift side extends for a distance equal to 5 cross sections of the island with respect to the normal to the drift. The zone of influence is half as great on the opposite side. Data indicating a significant difference in the influence of the shore on change in the normal and tangent components of the drift velocity vector as the distance from land increases were presented. Relative deformation of the area of an ice cover surface element was used to study ice compression and rarefaction. On the whole, the research results indicated the great possibilities for using side-looking radar to study the kinematics and dynamics of ice cover in greater depth. (See also W79-03596)(Sims-ISWS)

SEA SURFACE TEMPERATURE OBSERVATIONS BY A RADIATION THERMOMETER ABOARD AN ICE RECONNAISSANCE AIRCRAFT,
A. I. Paramonov, Yu. A. Gorbunov, and S. M Losev
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 112-118, August 1976. 2 fig, 2 tab, 2 ref.

Descriptors: *Remote sensing, *Temperature, *Oceans, *Sea ice, *Arctic, Aircraft, Equipment, Electronic equipment, Surveys, Water temperature, Infrared radiation, Ice, Ice cover, Oceanography, Sea surface temperature, Radiation thermometers.

The results of an inspection of the precision by which a PRT-5 radiation thermometer can measure the temperature of the sea surface, performed in August-September 1973 in the eastern Arctic, were presented. The observation materials confirmed the possibility of using this radiometer during airborne ice reconnaissance to measure water temperature on the sea surface, not only in the presence of ice but also in areas of open water between ice blocks of different degrees of compactness. Also, it was demonstrated that during the time of freezing, the temperature of ice of different ages differs significantly. (See also W79-03596)(Sims-ISWS)
W79-03616

USE OF ACOUSTIC METHODS TO ANALYZE SNOW AND ICE,
V. P. Gavrilo, and A. V. Gusev.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 119-125, August 1976. 2 fig, 6 ref.

Descriptors: *Remote sensing, *Acoustics, *Snow, *Ice, Physical properties, Mechanical properties, Temperature, Density, Salinity, Pressure, Sound waves, Ice-water interfaces, Elasticity(Mechanical), Viscosity, Laboratory tests, On-site investigations.

Grounds were given for the extensive possibilities of acoustic methods to study physical characteristics of freshwater, sea, and glacier ice and snow cover. Pulsed ultrasonic and resonant methods permitted a broad complex of measurements to determine the elastic characteristics of various types of ice and snow (for example Young's modulus, the shear modulus, the Poisson ratio, the viscosity coefficient, and attenuation and scattering of ultrasonic oscillations in ice depending on temperature, density, salinity, and static pressure). These measurements can be used to predict the mechanical properties of ice cover if data on its temperature and salinity are available. The applied significance of such research was demonstrated. (See also W79-03596)(Sims-ISWS)
W79-03617

ATTENUATION AND SCATTERING OF SOUND WAVES BY SEA ICE,
V. V. Bogorodskiy, G. Ye. Smirnov, and S. A. Smirnov
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 126-132, August 1976. 2 fig, 4 ref.

Descriptors: *Attenuation, *Absorption, *Sound waves, *Sea ice, Sonar, Remote sensing, Laboratory tests, On-site investigations, Ice, Oceans, Temperature, Crystals, Ultrasonics, Measurement, Theoretical analysis, Ice thickness.

Theoretical and experimental research on absorption and scattering of ultrasonic waves by sea ice structure was presented in this work. Explanation of the observed effects were given, and it was demonstrated that sea ice has different acoustic contrasts, which can be used to visualize the low ice surface. (See also W79-03596)(Sims-ISWS)
W79-03618

ONE METHOD FOR MEASURING SOUND ATTENUATION IN NATURAL ICE,
N. A. Grubnik, and O. V. Kudryavtsev
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research a

Engineering Laboratory, Hanover, New Hampshire, p 133-134, August 1976. 2 ref.

Descriptors: *Attenuation, *Sound waves, *Ice cover, Ice, Properties, On-site investigations, Measurement, Sea ice, Glaciers, Lake ice, Correlation analysis.

A method was described for direct measurement of attenuation of sound waves in natural ice based on using a complex wideband acoustic signal followed by its optimum processing. Attenuation coefficients were determined on the basis of the degree to which correlation maximums (observed upon matching of the instantaneous frequencies of the reference and directly received signals) decline, depending on range. (See also W79-03596)(Sims-ISWS)
W79-03619

SEISMIC AND TILT METER METHODS FOR ANALYZING ICE COVER,
V. N. Smirnov, and Ye. M. Lin'kov.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 135-139, August 1976. 1 fig, 1 tab, 4 ref.

Descriptors: *Seismic studies, *Ice cover, *Seismic waves, Ice, Sea ice, Lake ice, Loads(Forces), Stress, Elasticity(Mechanical), Deformation, Gravity waves, Mechanical properties, Physical properties, Ice breakup, Flexural-gravitational waves.

Two examples of ice cover analysis employing seismic methods were examined. The moduli of elasticity of ice cover determined by means of sag in response to a load and a dynamic method were compared. It was revealed from observations at the Severnyy Polyus-20 station that triggering stresses causing ice breakup arise when trains of flexural-gravitational waves appear suddenly in ice. A METHOD FOR MEASURING HIGH MOISTURE RESERVES IN SNOW COVER USING COSMIC RADIATION,
S. I. Avdyushin, Yu. F. Barabanshchikov, R. M. Kogan, Yu. M. Kulagin, and I. M. Nazarov.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 169-173, August 1976. 1 fig, 7 ref.

Descriptors: *Snow cover, *Moisture content, *Remote sensing, Radiation, Measurement, Instrumentation, Equipment, Mountains, Snowpacks, Snow surveys, Water resources, Snow, Cosmic radiation.

A system for measuring moisture reserves in montane snow was examined. The system is based on taking account of attenuation of galactic cosmic radiation by snow. The applicability of this system to measurement of moisture reserves at thicknesses from several hundred to several thousand millimeters was demonstrated. The apparatus was described, and the results of a long-term experiment at the high-altitude Kharam-Kul' Station of the Tadzhik SSR Administration of Hydrometeorological Service to determine water reserves in snow by means of recording galactic cosmic particles were presented. It was demonstrated that when the moisture reserves are from 10 to 900 mm, the precision with which they can be measured is 34 mm. It was noted that the greater part of error stems from daily variations in galactic cosmic radiation. A way to reduce this error was shown. (See also W79-03596)(Sims-ISWS)
W79-03626

A RADIO HYDROACOUSTIC METHOD FOR ANALYZING MODERATE-RANGE CHARACTERISTICS OF SEA ICE DYNAMICS,
V. V. Bogorodskiy, V. P. Gavrilo, and A. P. Polyakov.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 220-229, August 1976. 3 fig, 1 tab, 11 ref.

Descriptors: *Sea ice, *Movement, *Remote sensing, Radio, Acoustics, Model studies, Mathematical models, On-site investigations, Aerial photography, Ice, Cold regions, Arctic, Measurement, Equipment, Instrumentation, Ice movement, Ice breakup.

The basic physical premises of the radio hydroacoustic method for analyzing sea ice dynamics were developed. An experimental assessment was given of the precision of the method under the conditions of drifting ice on the Arctic Ocean, which assumes a value on the order of 0.01-0.03% of the measured range (about 20-30 km), not taking account of the effect of medium variability during the time of measurement. Models of drifting automatic radio hydroacoustic statons, which were used to make the first measurement of moderate-range characteristics of sea ice dynamics, were manufactured and tested. (See also W79-03596)(Sims-ISWS)

THE LANDSAT LAKE EUTROPHICATION STUDY,
Wisconsin Univ.-Madison. Dept. of Civil and Environmental Engineering.
K. W. Holmquist.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-290 678, Price codes: A06 in paper copy, A01 in microfiche. M.S. Thesis, 1977. 94 p, 11 fig, 6 tab, 12 ref, 6 append. OWRT A-062-WIS(2), 14-34-0001-5050, 14-34-0001-6052.

Descriptors: *Lakes, *Eutrophication, *Computer programs, *Remote sensing, Time series analysis, *Classification, Computer programs, Trophic levels, *ERTS, *LANDSAT imagery, *Wisconsin.

A cooperative program between the Wisconsin Department of Natural Resources and the University of Wisconsin has resulted in an initial assessment of the trophic status of inland lakes in the State of Wisconsin from LANDSAT data. The feasibility of using both the photographic representation of the LANDSAT imagery as well as the digital representation of the LANDSAT imagery to classify lakes was investigated. It was determined that LANDSAT imagery can be used to predict lake water parameters or trophic classification. Time series data analyses indicated the necessity of a periodic rather than a one-time data extraction process. The best lake classification can be derived from the digital representation of LANDSAT. Accounting for the differences in atmospheric conditions from day to day is an important consideration in the analysis of LANDSAT imagery. A collection of computer programs has been developed to derive lake trophic status from LANDSAT imagery which correlates well with ground calibration. This analysis technique is a cost-effective method of classifying inland lakes in Wisconsin.

APPARATUS AND METHOD FOR SAMPLING WATER FOR FISH LARVAE AND OTHER TROPHIC LEVELS,
Lawler, Matusky and Skelly Engineers, Tappan, NY. (Assignee)
P. M. McGroddy.
U.S. Patent No 4,117,726, 7 p, 6 fig, 2 ref, Official Gazette of the United States Patent Office, Vol 975, No 1, p 63, October 3, 1978.

Descriptors: *Patents, *Sampling, *On-site investigations, *Environmental effects, Water quality, Cooling water, Aquatic life, Fish, Larvae, Electric powerplants.

Samples of fish life in the larvae and egg stage and shortly thereafter, plankton and similar marine life are obtained by a two stage fine mesh partitions apparatus. By taking samples before and after water has passed through cooling facilities of electric generating plants along a river, some of the effects of the powerplant on the environment can be determined. The outstanding feature of this invention is that it collects the samples without passing the marine life through pumps in which much of it is killed or injured. Samples are collected in partially submerged equipment into which the water flows by gravity, and the water is discharged by pumps after the samples have been removed. (Sinha-OEIS)

MAP UNIT COMPOSITION ASSESSMENT USING DRAINAGE CLASSES DEFINED BY LANDSAT DATA,
Soil Conservation Service, Lafayette, IN.
F. R. Kirschner, S. A. Kaminsky, R. A. Weismiller, H. R. Sinclair, and E. J. Hinzel.
Soil Science Society of America Journal, Vol. 42, No. 5, p 768-771, September-October 1978. 3 fig, 2 tab, 15 ref. NASA NGL-15-005-186.

Descriptors: *Soil classification, *Drainage, *Remote sensing, *Satellites(Artificial), Soils, Soil types, Soil moisture, Vegetation, Mapping, Loam, Silts, Maps, Soil science, LANDSAT.

Soil survey map units are designed such that the dominant soil represents the major proportion of the unit. At times, soil mapping delineations do not represent adequately conditions as stated in the map unit descriptions. Digital analysis of LANDSAT multispectral scanner (MSS) data provides a means of accurately delineating and quantifying soil map unit composition. Digital analysis of LANDSAT MSS data collected on 9 June 1973 was used to prepare a spectral map for a 430-ha area in Clinton County, Indiana. Sixteen spectral classes were defined, representing 12 soil and 4 vegetation classes. The 12 spectral soil classes correlated with soil drainage characteristics and were grouped into four drainage classes. The four spectral vegetation classes were grouped for convenience into one vegetation class. The soil delineation produced using these groupings were compared to a conventionally prepared soil map. Three map units were investigated in detail: (1) Mahalasville silty clay loam, poorly drained; (2) Reesville silt loam, 0 to 2% slopes, somewhat poorly drained; and (3) Xenia silt loam, 2 to 6% slopes, eroded, moderately well drained. Results indicated that soil drainage characteristics can be identified. Correlation of drainage characteristics with soil series allows for the composition of soil map units to be accurately ascertained. (Sims-ISWS)

THE HYDROGEOLOGICAL RECONNAISSANCE MAPS OF ALBERTA,
Alberta Research Council, Edmonton. Groundwater Div.
J. Toth.
In: Contributions to the Hydrogeology of Alberta, Bulletin 35, Alberta Research Council, Edmonton, p 1-11, 1977. 5 fig, 33 ref.

Descriptors: *Hydrogeology, *Areal hydrogeology, *Mapping, *Canada, Geology, Maps, Groundwater, Wells, Water wells, Data collections, Surveys, Aquifers, Water resources, Water quality, Water yield, Hydrology, *Alberta(Canada).

In 1968, a program of hydrogeological reconnaissance mapping in Alberta was started by the Alberta Research Council, with completion envisaged in approximately 11 years. The purpose of the program is to publish hydrogeological maps, graphic portrayals of the groundwater conditions and their controlling factors--for each of 47 different areas in the province. These maps will provide an overview of the hydrogeological conditions in the province, and will assist in the solution of groundwater-related problems such as water resources development, land use planning, civil engineering and environmental queries, basic and applied research, and the planning of future research projects. The maps are published at the scales of 1:125,000, 1:250,000 or 1:500,000, depending upon the amount of available data. The main items on a typical map sheet are a central main map, 4 hydrogeological cross sections, 4 to 6 side maps, a conversion table and a legend. The maps, though self-contained, are accompanied by short reports which give information on features not readily illustrated pictorially. The sources of basic data include water well drillers' reports, oil company information, geological reports, chemical analysis of water samples, field surveys, test drilling, and pump testing. The maps are produced at a rate of one map sheet per geologist per year, or a total of 2 to 4 map sheets annually. Out of the approximately 47 mapped areas of the province, 32 have been mapped to date, and maps for 15 areas have been published. The average cost of the completed maps to the Alberta Research Council is approximately $15.5 per sq mi ($6.00 sq km) of area mapped. (See also W79-03819)(Sims-ISWS)

DLSPLOT: A COMPUTER PROGRAM FOR TRANSLATING DOMINION LAND SURVEY COORDINATES TO UNIVERSAL TRANSVERSE MERCATOR COMPATIBLE COORDINATES,
Alberta Research Council, Edmonton. Groundwater Div.
A. T. Lytviak.
In: Contributions to the Hydrogeology of Alberta, Bulletin 35, Alberta Research Council, Edmonton, p 65-92, 1977. 7 fig, 1 tab, 1 ref, 1 append.

Descriptors: *Mapping, *Computer programs, *Maps, Geologic mapping, Data processing, Data collections, Analytical techniques, Groundwater, Hydrography, Hydrologic data, Well data, Projections, Hydrology, Hydrogeologic mapping, Coordinate mapping, Coordinate systems, Coordinate translation, Map coordinates, Geography.

The computerization of many phases in the production of the reconnaissance hydrogeology map series has encountered difficulties inherent in mapping in a complex coordinate system. The National Topographic System, using Transverse Mercator projections, has polar coordinates. The Dominion Land Survey system is a synthesis of orthogonal and polar coordinate systems. The computer output device operates in an orthogonal system. Dominion Land Survey coordinates are used for input and National Topographic System compatible maps are desired as output, mapping by computer must invoke a suitable translation program. The construction of such a program was undertaken by simplifying the coordinate system to a minimum extent consistent with keeping the resolution errors within set limits. The scale of 1:250,000 was used as a criterion for acceptability, as this scale is most commonly used in the reconnaissance map series. Simplicity of utilization was achieved by minimizing the parameters necessary to define the area to be plotted. Three parameters were found necessary and additional ones useful. These par

eters were: horizontal field in ranges, the vertical field in townships the scale as a ratio, and two adjustment factors. (See also W79-03819)(Sims-ISWS)

Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 104, No WR1, p 139-156, November 1978. 4 fig, 11 tab, 37 ref.

Descriptors: *Hydroelectric power, *Remote sensing, *Streamflow forecasting, *Information systems, Flood control, Decision making, Reservoirs, *Watersheds(Basins), Multiple-purpose reservoirs, Optimization, California, Sensitivity analysis, Energy loss, Runoff, Mathematical models, Systems analysis.

A method of analysis is described with the objective of determining how (and whether) aerospace-derived information system technology can effectively increase hydropower production. The increase in annual hydropower benefits is derived from more accurate reservoir inflow forecasting based upon the use of new or improved sensors and satellite data relay systems. Sensitivity analyses are presented for watershed parameters imbedded in conceptual watershed models. Results are related to hydropower production and sensor requirements via a reservoir optimization model to establish information system requirements. A numerical example is presented using a typical multiple-purpose reservoir system located in northern California. (Bell-Cornell)

Available from the National Technical Information Service, Springfield, VA. 22161 as PB-261 315, Price codes: A09 in paper copy, A01 in microfiche. Final Report Volume I IIHR Report No. 191, July 1976. 169p, 45 fig, 9 tab, 72 ref. OWRT C-6011(5201)(2), 14-31-0001-5201.

Descriptors: *Consumptive use, *Cooling towers, *Powerplants, *Thermal pollution, *Thermal powerplants, *Water cooling, *Water consumption, Dry cooling, Dry-wet combination, Cooling system design, Waste heat, Wet cooling.

A comprehensive computer code was developed for the assessment of the economics of various types of combination dry-wet cooling towers for steam-electric power plants. The model considered the basic thermodynamics of wet (evaporative) and dry (conductive) heat transfer, steam turbines, condensers, and the influence of different power loading patterns and changing meteorological conditions, as well as the various economic parameters. In the latter category are the capital costs associated with the equipment as well as the lost capacity at extreme meteorological conditions, and the operating costs resulting from fuel consumption, water usage, maintenance, internal power requirements, and under-production of energy. Studies were made of the thermodynamic and economic performance of several parallel and series air path dry-wet cooling tower configurations. In addition to demonstrating the general usefulness of the models, several promising configurations were identified which seem attractive in their economic, water conservation, and fog abatement aspects. In particular, it parallel air path towers are more flexible and effective than comparable series air path arrangements. The most favorable configuration is the one in which separate dry and wet units of conventional design are utilized simultaneously. Combination dry-wet cooling towers are economical in comparison with conventional wet towers when the cost of water is sufficiently high. (See also W79-03662) (Giaquinta-Iowa)

Descriptors: *Thermal powerplants, *Cooling systems, Cooling ponds, *Cooling towers, Once-through, *Economic analysis, Waste heat, Water consumption, Thermal pollution, *Alternative planning.

An overview of cooling alternatives and detailed system thermodynamics are presented. Computer models are developed and used to study the thermal characteristics, economics, and water consumption of wet tower/cooling pond and wet tower/once-through combination cooling systems. The effects of both meteorological conditions and economic parameters are examined to identify optimum cooling system configurations for several case studies. The case studies illustrate the cooling system arrangements which are attractive from both their economic or water conservation aspects. The combination cooling systems also are compared with dry/wet cooling systems. The parallel water path configuration of the wet tower/cooling pond combination cooling system is economically superior to the series water path configuration for meteorological conditions of Los Angeles, California. For the wet tower/once-through combination cooling system, a series water-path arrangement with a partially closed-cycle loop appears to be the most attractive configuration for meteorological conditions of Sioux City, Iowa. Combination wet tower/once-through cooling systems are more economical than once-through cooling associated with low river heat assimilation capacity. This report is Volume II of the Final Report to the Office of Water Research and Technology; Volume I is IIHR Report No 191 entitled: 'Analysis of Different Types of Dry-Wet Cooling Towers'. IIHR Limited Distribution Report No 58 contains the computer program listings and input data which were used to perform the calculations. (See also W79-03661)

METHOD AND APPARATUS FOR CONTROLLING A WATER TURBINE,
Leyrpic - Creusot Loire, Grenoble (France). (Assignee).; and Compagnie Nationale du Rhone, Lyons (France). (Assignee).
L. Megnint.
U.S. Patent No. 4,120,602, 5 p, 3 fig, 10 ref; Official Gazette of the United States Patent Office, Vol. 975, No. 3, p. 1043, October 17, 1978.

Descriptors: *Patents, *Water control, *Hydraulic turbines, Bulb turbines, Sluice gates, Flow control, Guide vanes.

With a view to simplying the structure of mobile guide vane assemblies and in particular those of bulb type turbines, the invention provides a method of controlling the operation of a bulb type water turbine. The mobile guide vane assembly serve only to deflect the water during operation, the starting and stopping of the turbine being controlled and water-tight sealing when the turbine is stopped is provided by a gate sluice. Under these conditions, the guide vane assembly need not be water-tight and it comprises vanes having limited angular play which is sufficient to produce the required deflection of water during operation of the turbine. The clearance between the guide vanes and the housing plates can be greater, hence allowing a more simplified shape of the parts and machining which is not so precise. It is also possible to impart a better hydraulic shape to the vanes. Lastly, the number and the length of the vanes can be reduced, for the guide vane assembly no longer has to close the duct completely. (Sinha-OEIS)

INVESTIGATION OF THE FEASIBILITY OF DEWATERING BURIED VALLEY SANDS TO AID SEWER-TUNNEL EXCAVATIONS, EDMONTON, ALBERTA,
Alberta Research Council, Edmonton. Groundwater Div.
G. M. Gabert.
In: Contributions to the Hydrogeology of Alberta, Bulletin 35, Alberta Research Council, Edmonton, p 41-53, 1977. 14 fig, 2 tab, 3 ref.

Descriptors: *Dewatering, *Tunnels, *Sands, Sand aquifers, Wells, Water wells, Pumping, Observation wells, Drawdown, Tunnel failure, Sewers, Structures, Geology, Aquifers, Engineering, Civil engineering, *Edmonton(Alberta), *Alberta(Canada), Drawdown curves, Sand flows

Excavation of a large-diameter sewer tunnel in the City of Edmonton was brought to a halt twice in 1973 because of the flow of saturated sand into the tunnel from the excavation front. A production well and observation wells were installed, and an aquifer test was conducted to provide basic data to calculate the feasibility of dewatering buried valley

sands overlying the tunnel. Conclusions showed: (1) that dewatering is feasible using 20 wells spaced 10 ft apart in an arrangement of two lines 30 ft apart parallel and adjacent to each side of the position of the tunnel; (2) that well completions can be inexpensive and that each well would have to be pumped at 25 igpm or higher; and (3) that at least 1 week or more of continuous pumping would be required. MECHANICAL PROPERTIES OF SNOW AS A CONSTRUCTION MATERIAL,
A. F. Vuori.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 155-162, August 1976. 3 fig, 1 tab, 14 ref.

Descriptors: *Snow, *Mechanical properties, *Construction materials, *Cold weather construction, Foundations, Roads, Road construction, Runways, Construction, Cold regions, Loads(Forces), Deformation, Stress, Density, Strength, Strength of materials, Rheology.

Various snow processing methods can be used to transform snow into a useful construction material in polar regions, where use of conventional construction materials is uneconomical or impossible. This transformation is associated with significant change in mechanical properties of snow. This work was devoted to the results of research on this change. The problems of using compacted snow to build roads, runways, and foundations for various structures were examined. (See also W79-03596)(Sims-ISWS)
W79-03624

METHODS FOR MEASURING THE STRENGTH CHARACTERISTICS OF NATURAL AND PROCESSED SNOW,
G. Abel'.
In: Physical Methods of Studying Ice and Snow, Draft Translation 539, Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire, p 174-184, August 1976. 3 fig, 3 tab, 14 ref.

Descriptors: *Snow, *Mechanical properties, *Strength, *Measurement, Methodology, Construction materials, Strength of materials, Equipment, Instrumentation, Loads(Forces), Deformation, Stress, Density, Construction, Cold regions, Cold weather construction, Foundations, Roads, Runways, Rheology, Natural snow, Processed snow.

A review of snow strength characteristic tests was presented. Recommendations for using the most convenient methods and instruments in the field were given on the basis of a comparative analysis. The author has developed a classification of methods based on the 'desirability of use' of a particular testing method. (See also W79-03596)(Sims-ISWS)

Arsenic Determination by the Silver Diethyldithiocarbamate Method and the Elimination of Metal Ion Interference,
W79-03982 5A

IOWA
Relative Evaluation of Water Stress Indicators for Soybeans,
W79-03521 3F

IRRIGATED LAND
National Conference on Management of Nitrogen in Irrigated Agriculture.
W79-03941 5G

Overview of Nitrogen in Irrigated Agriculture,
W79-03959 5G

IRRIGATION
Effects of Spary Irrigation of Municipal Wastewater on the Physical Properties of the Soil,
W79-03766 5C

Method and Means for Irrigating Soil and Growing Plants Having Varying Water Requirements,
W79-03780 3F

Water Collection Indicator Device.
W79-03785 3F

Mobile Agricultural Irrigation Apparatus,
W79-03786 3F

Fluid Spray Head and Method Adapted to Spray Specific Pattern,
W79-03787 3F

Center Pivot Irrigation Apparatus,
W79-03794 3F

Measurement of Furrow Infiltraton Rates Made Easy,
W79-03807 7B

IRRIGATION EFFICIENCY
Management of Saline Water,
W79-03774 6B

IRRIGATION PROJECTS
Combating Pheasant Losses in the Columbia Basin - Where do we Go from Here,
W79-03686 6B

IRRIGATION SYSTEMS
Radiation and Energy Balance of a Trickle-Irrigated Lemon Grove,
W79-03828 3F

IRRIGATION WATER
Sources of Nitrogen for Crop Utilization,
W79-03944 5G

ISLANDS
Fresh Ground Water Found Deep Beneath Nantucket Island, Massachusetts,
W79-03690 1A

ISOCHRYSIS
Polychlorinated Biphenyl (PCB) Effects on Marine Phytoplankton Photosynthesis and Cell Division,
W79-03650 5C

ISOPRENALINE
Vascular Effects of Acetylcholine, Catecholamines and Detergents on Isolated Perfused Gills of Pink Salmon, Oncorhynchus Gorbuscha, Coho Salmon, O. Kisutch and Chum Salmon, O. Keta,
W79-03646 5C

ISOTOPE STUDIES
237Pu Experiments with the Plaice Pleuronectes Platessa,
W79-03901 5C

JAUMEAN
The Effect of Competition and Salinity on the Growth of a Salt Marsh Plant Species,
W79-03634 2I

KELPS
Effects of Sediments on the Development of Macrocystis Pyrifera Gametophytes,
W79-03905 5C

KEPONE
Survival, Duration of Larval Stages, and Size of Post-Larvae of Grass Shrimp, Palaemonetes Pugio, Reared from Kepone Contaminated and Uncontaminated Populations in Chesapeake Bay,
W79-03642 5C

Human Population Exposures to Mirex and Kepone,
W79-04000 5C

KINETICS
On the Kinetics of Light-Limited Growth of Scenedesmus Protuberans Fritsch and Ecological Implications,
W79-03855 5C

Nutrient Kinetics of Freshwater Planktonic Algae Using Batch and Semicontinuous Methods,
W79-03857 5A

Phosphorus Kinetics--Algal Growth Relationships in Batch Cultures,
W79-03861 5C

A Mathematical Model for Growth of Phytoplankton,
W79-03862 5C

LABORATORY CERTIFICATION
Manual for the Interim Certification of Laboratories Involved in Analyzing Public Drinking Water Supplies -- Criteria and Procedures,
W79-03979 5A

LABORATORY EQUIPMENT
A Modified Turbidostatic System for Algal Population Studies,
W79-03847 5A

The Use of Small, Continuous and Multispecies Cultures to Investigate the Ecology of Phytoplankton in a Scottish Sea-Loch,
W79-03879 5C

LABORATORY TESTS
Electric Properties of Ice Formed in a Vacuum, and Their Relationship to Structure,
W79-03606 2C

Ice Pressure on Separately Standing Supports in Laboratory and Natural Tests,
W79-03607 2C

Effect of Sea Ice Salinity on Optical Extinction at Wavelength 6,328 A,
W79-03608 2C

Optical Characteristics of Some Varieties of Natural Ice,
W79-03609 2C

Instruments for Analyzing Spectral Reflection of Liquid Water in the Wavelength Range from 1 to 50 Microns,
W79-03610 7B

Experimental Study of Ice Adhesion in the Laboratory and In Situ,
W79-03622 2C

Analysis of the Ice Layer Breakdown Process,
W79-03623 2C

Arsenic Determination by the Silver Diethyldithiocarbamate Method and the Elimination of Metal Ion Interference,
W79-03982 5A

The Selenastrum Capricornutum Printz Algal Assay Bottle Test Experimental Design, Application, and Data Interpretation Protocol.
W79-03996 5A

LABRADOR SHELF
Early Deglaciation of the Labrador Shelf,
W79-03814 2C

LAGOONS
The Community Structure of a Tropical Marine Lagoon,
W79-03817 2L

LAKE CHAMPLAIN
An Analysis of Lake Level Influence on Vegetation in Lake Champlain.
W79-03745 2H

LAKE ERIE
The Decline of Lake Plants.
W79-03508 5C

Demonstration of Interim Techniques of Polluted Beachwater,
W79-03576 5G

LAKE ICE
Analysis of the Mechanical Properties of Freshwater Ice in the Presence of Slow Load Changes,
W79-03629 2C

LAKE MICHIGAN
Potential Sources of Asbestos in Lake Michigan,
W79-03809 5B

Polychlorinated Biphenyls in Precipitation in the Lake Michigan Basin,
W79-03993 5C

LAKE ONTARIO
Scenario for an Ongoing Chlorophyll a Surveillance Plan on Lake Ontario for Non-Intensive Sampling Years,
W79-03808 5A

Mirex in the Sediments of Lake Ontario,
W79-03810 5B

Theoretical Model of the Littoral Drift System in the Toronto Waterfront Area, Lake Ontario,
W79-03811 2H

Size Dependent Model of Hazardous Substances in Aquatic Food Chain,
W79-03997 5C

LAKE SUPERIOR
Geologic Pollution Problems of Lake Superior,
W79-03938 5B

LAKE TAHOE (CA NV)
The Use of Natural Phytoplankton Populations in Bioassay,
W79-03876 5A

LAKES
The Decline of Lake Plants,
W79-03508 5C

Semi-Infinite Solid Model for Prediction of Temperature in Deep Reservoirs and Lakes,
W79-03581 2H

Enhancement of Sockeye Salmon (Oncorhynchus Nerka) by Lake Fertilization in Great Central Lake: Summary Report,
W79-03658 5C

The LANDSAT Lake Eutrophication Study,
W79-03682 7B

Carbon Flow in Four Lake Ecosystems: A Structural Approach,
W79-03815 5C

A Mathematical Model for Growth of Phytoplankton,

Eutrophication in the United States: Past-Present-Future,
W79-03915 5G

Distribution of Phytoplankton in North Carolina Lakes,
W79-03990 5C

Distribution of Phytoplankton in Indiana Lakes,
W79-03991 5C

LAMPREYS
Sea Lamprey (Petromyzon Marinus Linnaeus) in the Saint Lawrence Great Lakes of North America: Effects, Control, Results,
W79-03925 5C

LAMPRICIDES
Registration of Pesticides: Considerations in Conducting Aquatic Toxicity Tests,
W79-03922 5A

Sea Lamprey (Petromyzon Marinus Linnaeus) in the Saint Lawrence Great Lakes of North America: Effects, Control, Results,
W79-03925 5C

LAND DEVELOPMENT
Water Resource Standards for Second Home and Recreational Land Development,
W79-03675 5G

LAND MANAGEMENT
Land Use/Cover in the Devils Lake Basin, May-June, 1975.
W79-03672 4D

Environmentalizing Agricultural Production Control Policies,
W79-03767 5G

LAND USE
Continuous Simulation of Nonpoint Pollution,
W79-03515 5B

Urban Runoff Control Master Planning,
W79-03532 6B

Land Use Allocation Model for Flood Control,
W79-03534 4A

Land Use/Cover in the Devils Lake Basin, May-June, 1975.
W79-03672 4D

LANDFILLS
Measurement of the Engineering Properties of Municipal Incinerator Residues and Consideration of Leachate Characteristics,
W79-03685 5B

A Case Study of Hazardous Wastes in Class I Landfills,
W79-03984 5B

Liners for Sanitary Landfills and Chemical and Hazardous Waste Disposal Sites,
W79-03985 5G

LANDSAT IMAGERY
The LANDSAT Lake Eutrophication Study,
W79-03682 7B

LARVAE
A Bioenergetic Model for the Analysis of Feeding and Survival Potential of Winter Flounder, Pseudopleuronectes Americanus, Larvae During the Period from Hatching to Metamorphosis,
W79-03548 5C

LARVAL GROWTH STAGE
A Bioenergetic Model for the Analysis of Feeding and Survival Potential of Winter Flounder, Pseudopleuronectes Americanus, Larvae During the Period from Hatching to Metamorphosis,
W79-03548 5C

LARVICIDES
Accumulation of the Organophosphate Blackfly Larvicide Abate (Temephos) in Sarotherodon Mossambicus, with Reference to the Larvicidal Control of Simulium Damnosum,
W79-03647 5C

LASERS
Analysis of Glacier Dynamics Using a Laser Deformograph,
W79-03621 2C

LEACHATE
Measurement of the Engineering Properties of Municipal Incinerator Residues and Consideration of Leachate Characteristics,
W79-03685 5B

Investigation of Landfill Leachate Pollutant Attenuation by Soils,
W79-03983 5B

LEACHATES
Effect of Soil Moisture Content Upon Adsorption and Movement of Phosphorus from Leachates of Domestic Waste Disposal Systems
W79-03683 5B

LEACHING
Factors Affecting Atrazine Adsorption, Degradation and Mobility in Soil,
W79-03670 5B

Displacement of Soil Water by Simulated Rainfall,

W79-03512 5C

MODEL STUDIES

Simulation Procedures for Box-Jenkins Models,
W79-03523 2E

A Bioenergetic Model for the Analysis of Feeding and Survival Potential of Winter Flounder, Pseudopleuronectes Americanus, Larvae During the Period from Hatching to Metamorphosis,
W79-03548 5C

Regional Econometric Forecasting Models: A Test of Structural Generality, Disaggregation Effects, and Policy Analysis Potentials,
W79-03593 6A

Emissivity o Ice, Terrestrial, and Sea Surfaces Modeled by Stratified Heterogeneous Structures,
W79-03602 2C

Analysis of the Mechanical Properties of Freshwater Ice in the Presence of Slow Load Changes,
W79-03629 2C

Dynamic Model of Nutrification in Huntington Bay, New York,
W79-03638 5B

On the Theory and Modeling of Dynamic Programming with Applications in Reservoir Operation,
W79-03671 4A

Contributed Papers on Coastal Ecological Characterization Studies. Fourth Biennial International Estuarine Research Federation Conference, October, 1977.
W79-03697 2L

User-Oriented Conceptual Modeling in the Ecological Characterization of the Sea Islands and Coastal Plain of South Carolina and Georgia,
W79-03701 6A

Maine Coast Characterization User's Guide,
W79-03703 2L

A Conceptual Model for the Movement of Pesticides Through the Environment: A Contribution of the EPA Alternative Chemicals Program,
W79-03757 5B

A Mathematical Treatment of Infiltration from a Line Source into an Inclined Porous Medium,
W79-03800 2G

Theoretical Model of the Littoral Drift System in the Toronto Waterfront Area, Lake Ontario,
W79-03811 2H

Actual Evapotranspiration Over a Summer Period in the 'Hupsel Catchment',
W79-03813 2D

Teledeltos Modelling of Homogeneous and Heterogeneous Groundwater Systems,
W79-03825 2F

The Role of Nutrient Competition in a Predictive Theory of Phytoplankton Population Dynamics,
W79-03893 5C

A Steady-State Phytoplankton Model of Chesapeake Bay,
W79-03899 5C

Solute Travel-Time Estimates for Tile-Drained Fields: III. Removal of a Geothermal Brine Spill from Oil by Leaching,
W79-03961 2G

MODELS

Urban Runoff Control Master Planning,
W79-03532 6B

MOISTURE

Vegetation Changes in Shallow Marsh Wetlands Under Improving Moisture Regime,
W79-03735 2I

MOISTURE CONTENT
A Method for Measuring High Moisture Reserves in Snow Cover Using Cosmic Radiation.
W79-03626 7B

Effect of Soil Moisture Content Upon Adsorption and Movement of Phosphorus from Leachates of Domestic Waste Disposal Systems.
W79-03683 5B

Gravimetric VS. Volumetric Determination of Water Storage in Vertically Unstable Tillage Layers.
W79-03806 7B

MOISTURE DEFICIT
Effects of Soil Water Stress on Growth and Nutrient Accumulation in Corn.
W79-03553 3F

MOISTURE STRESS
Relative Evaluation of Water Stress Indicators for Soybeans.
W79-03521 3F

Effects of Soil Water Stress on Growth and Nutrient Accumulation in Corn.
W79-03553 3F

MOISTURE TENSION
Effects of Soil Water Stress on Growth and Nutrient Accumulation in Corn.
W79-03553 3F

MOLLUSKS
Upper Temperature Tolerances of Tellina Tenuis and T. Fabula.
W79-03557 5C

Survey of Benthic Coral Reef Ecosystems, Fish Populations, and Micromollusks in the Vicinity of the Wai'anae Sewage Ocean Outfall, O'Ahu, Hawaii -- Summer 1975.
W79-03591 5E

MOLYBDENUM
The Use of Natural Phytoplankton Populations in Bioassay.
W79-03876 5A

MONITORING
Design and Analysis of Aquatic Monitoring Programs at Nuclear Power Plants.
W79-03566 5G

Aquatic and Terrestrial Surveys in the Vicinity of Power Plants using Remote Sensing.
W79-03567 5A

Water System Virus Detection,
W79-03784 5A

Monitoring the Condition of Flowing Waters by Biological Oranisms.
W79-03913 5A

Toxicity Tests in the Regulation of Waste Discharges in the United States.
W79-03926 5A

Toxicological Control of Pollution of Freshwaters.
W79-03927 5A

Principles and Methods of Biological Establishment of the Norms of Chemical Substances and Evaluation of the Level of Pollution in Water-Bodies.
W79-03929 5G

A Research System for Developing Fisheries Standards for Water Quality, Considering the Peculiarities of Transferring Experimental Data to Natural Water Bodies,
W79-03933 5G

Monitoring Water for Nitrogen Losses from Croplands.
W79-03950 5G

MONOD EQUATION
Nutrient Kinetics of Freshwater Planktonic Algae Using Batch and Semicontinuous Methods.
W79-03857 5A

The Role of Nutrient Competition in a Predictive Theory of Phytoplankton Population Dynamics.
W79-03893 5C

MONTMORILLONITE
Coupling Phenomena in Saturated Homo-Ionic Montmorillonite: III. Analysis.
W79-03962 2G

MORTALITY
Mortality Patterns in Trout (Salmo Trutta and S. Gairdneri) Exposed to an Anionic Detergent in Relation to Concentration and Mechanisms of Toxic Action.
W79-03637 5C

Mortality and Initial Propagule Size in Mangrove Seedlings in Panama.
W79-03740 2I

Toxicity Tests in the Regulation of Waste Discharges in the United States.
W79-03926 5A

MOTORBOAT POLLUTION
Motorboat Use on the Wild Rogue River: An Investigation of Use Between Watson Creek and Blossom Bar.
W79-03695 5B

MOVEMENT
Analysis of Glacier Dynamics Using a Laser Deformograph.
W79-03621 2C

A Radio Hydroacoustic Method for Analyzing Moderate-Range Characteristics of Sea Ice Dynamics.
W79-03633 7B

MULCHING
The Effect of Stabilized, Hydrophobic Aggregate Layer Properties on Soil Water Regime and Seedling Emergence,
W79-03803 2G

MULLET
Aspects of Estuarine Intertidal Ecology of Juvenile Striped Mullet, Mugil Cephalus, in Hawaii,
W79-03561 5C

MULLETS
Effects of Some Trace Elements on the Blood of Kuwait Mullets Liza Macrolepis (Smith).
W79-03504 5C

Routine Oxygen Consumption of Mugil Cephalus, Liza Dumerili and L. Richardsoni at Different Temperatures and Salinities.
W79-03652 5C

MULTIPLE-PURPOSE
Optimal Sequencing for a Multipurpose Water Supply System.
W79-03518 4A

MULTIPLE REGRESSION TECHNIQUES
Some Effects of Soil Surface Cover on Infiltration.
W79-03676 2G

MUNICIPAL WASTES
Measurement of the Engineering Properties of Municipal Incinerator Residues and Consideration of Leachate Characteristics.
W79-03685 5B

Effects of Spary Irrigation of Municipal Wastewater on the Physical Properties of the Soil.
W79-03766 5C

Preliminary Environmental Assessment of Biomass Conversion to Synthetic Fuels,
W79-03973 5G

MUNICIPAL WASTEWATER
Effects of Spary Irrigation of Municipal Wastewater on the Physical Properties of the Soil.
W79-03766 5C

MUSSELS
Histopathological Effects Induced in Mytilus Edulis by Mytilicola Intestinalis and the Histochemistry of the Copepod Intestinal Cells,
W79-03544 5C

Physiological Responses of Mytilus Edulis L. to Parasitic Infestation by Mytilicola Intestinalis,
W79-03545 5C

Lysosomal Responses to Experimentally Injected Anthracene in the Digestive Cells of Mytilus Edulis,
W79-03900 5C

MUTAGENS
Mercury, Lead, Arsenic, and Cadmium in Biological Tissue. The Need for Adequate Standard Reference Materials.
W79-03995 5A

NANTUCKET ISLAND
Fresh Ground Water Found Deep Beneath Nantucket Island, Massachusetts,
W79-03690 1A

NATIONAL EUTROPHICATION SURVEY
Distribution of Phytoplankton in Illinois Lakes,
W79-03989 5C

Distribution of Phytoplankton in North Carolina Lakes.
W79-03990 5C

Distribution of Phytoplankton in Indiana Lakes,
W79-03991 5C

NATURAL GAS
Aliphatic Acid Anions in Oil-Field Waters--Implications for Origin of Natural Gas.
W79-03558 1A

NAVIGATION
Recent Developments in the McClellan-Kerr Arkansas River Navigation System Area.
W79-03526 4A

NEARSHORE ENVIRONMENT
Impact of Nearshore Development on Open Coastal Resources.
W79-03829 5C

NEREIS
Polychlorinated Biphenyls: Accumulation from Contaminated Sediments and Water by the Polychaete Nereis Diversicolor.
W79-03904 5C

NESTING
The Effects of Ditching a Salt Marsh on Colony and Nest Site Selection by Herring Gulls (Larus Argentatus).
W79-03752 6G

NETHERLANDS
Actual Evapotranspiration Over a Summer Period in the 'Hupsel Catchment'.
W79-03813 2D

NETWORKS
Evaluating the Sampling Frequencies of Water Quality Monitoring Networks,
W79-03976 5C

NEW HAMPSHIRE
The Effects of Spary Irrigation on a Mixed Forest Ecosystem,
W79-03679 5C

NEW JERSEY
Methodologies of Examining Pollution from Urban Runoff,
W79-03689 5B

Primary Production in the Freshwater Marsh Ecosystem of Troy Meadows, New Jersey,
W79-03758 2H

NEW MEXICO
Recharge and Groundwater Conditions in the Western Region of the Roswell Basin,
W79-03663 2F

Classification of Riparian Vegetation,
W79-03715 2I

NEW YORK
Dynamic Model of Nutrification in Huntington Bay, New York,
W79-03638 5B

The Life History of Shoots of Carex Lacustris,
W79-03733 2I

Primary Production and Life History of Carex Lacustris,
W79-03737 2I

NITRATES
An Experimental Simulation of Changes in Diatom and Flagellate Blooms,
W79-03511 5C

Voltammetric Determination of Trace Quantities of Nitrate in an Anion Exchange Membrane Isolated Cell,
W79-03771 5A

National Conference on Management of Nitrogen in Irrigated Agriculture.
W79-03941 5G

Leaching of Nitrate from Soils,
W79-03948 5G

Effect of Water Management on Nitrate Leaching,
W79-03949 3F

A Case Study-Nitrates in the Upper Santa Ana River Basin in Relation to Groundwater Pollution,
W79-03955 5B

NITRIFICATION
Effects of Trace Elements on Nitrification in Soils,
W79-03705 5A

Mineralization, Immobilization and Nitrification,
W79-03945 2K

NITRITES
Ammonia and Nitrite Toxicity to Fishes,
W79-03932 5C

NITROGEN
Accumulation and Redistribution Pattern of Dry Matter and N in Triticale and Wheat Varieties under Water Stress Condition,
W79-03530 3F

Phytoplankton Nitrogen Metabolism, Nitrogen Budgets, and Observations on Copper Toxicity: Controlled Ecosystem Pollution Experiment,
W79-03738 5A

Nitrogen and Phosphorus Storage and Utilization in Blue-Green Algae,
W79-03865 5C

N-Uptake and Pigmentation of N-Limited Chemostat Cultures and Natural Populations of Oscillatoria Agardhii,
W79-03868 5C

The Use of Natural Phytoplankton Populations in Bioassay,
W79-03876 5A

Modeling of N- and P- Uptake by Scenedesmus Acutus, with Regard to Tertiary Treatment of Domestic Waste Water,
W79-03885 5C

National Conference on Management of Nitrogen in Irrigated Agriculture.
W79-03941 5G

The Indispensable Role of Nitrogen in Agricultural Production,
W79-03942 3F

Nitrogen Forms and Cycling in Relation to Water Quality,
W79-03943 5G

Sources of Nitrogen for Crop Utilization,
W79-03944 5G

Removal of Nitrogen by Various Irrigated Crops,
W79-03946 3F

Volatile Losses of Nitrogen from Soil,
W79-03947 3F

Effect of Water Management on Nitrate Leaching,
W79-03949 3F

Monitoring Water for Nitrogen Losses from Croplands,
W79-03950 5G

Use of Mathematical Relationships to Describe the Behavior of Nitrogen in the Crop Root Zone,
W79-03952 3F

Diagnostic Techniques Used to Identify Optimum Levels of Nitrogen Fertilization for Irrigated Crops,
W79-03953 3F

A Case Study-Nitrates in the Upper Santa Ana River Basin in Relation to Groundwater Pollution,
W79-03955 5B

Economic Impacts of Controlling Nitrogen Concentration and Other Water Quality Determinants in the Yakima River Basin,
W79-03956 5G

Nitrogen Balances for the Santa Maria Valley,
W79-03957 5G

Overview of Nitrogen in Irrigated Agriculture,
W79-03959 5G

NITROGEN COMPOUNDS
Ammonia and Nitrite Toxicity to Fishes,
W79-03932 5C

NITROGEN CYCLE
National Conference on Management of Nitrogen in Irrigated Agriculture.
W79-03941 5G

Nitrogen Forms and Cycling in Relation to Water Quality,
W79-03943 5G

NITROGEN FIXATION
Measuring Symbiotic Nitrogen Fixation in Rangeland Plots of Trifolium Subterraneum L. and Bromus Mollis L.,
W79-03552 7B

NITROGEN METABOLISM
Phytoplankton Nitrogen Metabolism, Nitrogen Budgets, and Observations on Copper Toxicity: Controlled Ecosystem Pollution Experiment,
W79-03738 5A

NITZSCHIA PALEA
Growth Cycle of a Freshwater Diatom,
W79-03856 5C

NOMOGRAMS
Apparent Transmissivity and its Determination by Nomogram,
W79-03821 2F

NON-MARKET IMPACTS
Methods for Evaluating Non-Market Impacts in Policy Decisions with Special Reference to Water Resources Development Projects,
W79-03525 6B

NON-STRUCTURAL ALTERNATIVES
Land Use Allocation Model for Flood Control,
W79-03534 4A

NONPOINT POLLUTION
Continuous Simulation of Nonpoint Pollution,
W79-03515 5B

NONPOINT POLLUTION SOURCES
Economic Concepts and Policies Related to Controlling Non-Point Source Pollution Stemming from Agriculture,
W79-03954 5G

NONPOINT SOURCE MODEL
Continuous Simulation of Nonpoint Pollution,
W79-03515 5B

NORTH CAROLINA
Public Participation in 208 Water Quality Planning: A Case Study of Triangle J Council of Government, North Carolina,
W79-03666 5G

Water Resource Standards for Second Home and Recreational Land Development,
W79-03675 5G

Distribution of Phytoplankton in North Carolina Lakes,
W79-03990 5C

NORTH DAKOTA
Land Use/Cover in the Devils Lake Basin, May-June, 1975.
W79-03672 4D

Ecological Distribution of Breeding Waterfowl Populations in North Dakota
W79-03732 2I

NORTHEAST U.S.
Fresh Groundwater Beneath Continental Shelf: Findings of Atlantic Continental-Margin Drilling Program,
W79-03562 1A

Origin of Fresh Ground Water Beneath the U.S. Atlantic Continental Shelf,
W79-03589 1A

NORWAY
The Fertility of Some Norwegian Inland Waters Assayed by Algal Cultures,
W79-03880 5A

NUCLEAR ACCELERATION
The Multielemental Analysis of Drinking Water Using Proton-Induced X-Ray Emission (PIXE),
W79-03981 5A

NUISANCE ALGAE
Role of Inorganic Carbon Availability in the Formation of Nuisance Blooms of Blue-Green Algae,
W79-03762 5C

NUTRIENT DEFICIENCY
Physiological Indicators of Nutrient Deficiency in Algae,
W79-03846 5A

NUTRIENT LOADING
Phytoplankton Nitrogen Metabolism, Nitrogen Budgets, and Observations on Copper Toxicity: Controlled Ecosystem Pollution Experiment,
W79-03738 5A

NUTRIENT REMOVAL
Nitrate Accumulation in Soils and Loss in Tile Drainage Following Nitrogen Applications to Continuous Corn,
W79-03653 2K

The Behavior of Nutrient Elements Added to a Forest Soil with Sewage Sludge,
W79-03805 5B

Modeling of N- and P- Uptake by Scenedesmus Acutus, with Regard to Tertiary Treatment of Domestic Waste Water,
W79-03885 5C

Research on the Tertiary Treatment of Swine Manure by Mass Culturing of Algae,
W79-03886 5D

Removal of Nitrogen by Various Irrigated Crops,
W79-03946 3F

NUTRIENT REQUIREMENTS
Evaluation of Protein and Nutritive Fiber Content of Cultivated Russian - Thistle,
W79-03587 3F

NUTRIENTS
Dynamic Model of Nutrification in Huntington Bay, New York,
W79-03638 5B

Comparative Growth and Foliar Element Concentrations of Larix Laricina Over a Range of Wetland Types in Minnesota,
W79-03739 2I

Seasonal Ionic Fluctuations in a Phragmites Communis Community,
W79-03747 2I

Nutrient and Water Levels in a Small Michigan Bog with High Tree Mortality,
W79-03751 2I

Mineral Concentrations in Papyrus in Various African Swamps,
W79-03753 2I

Chemical Inputs by a Colony of Franklin's Gulls Nesting in Cattails,
W79-03755 2I

Production, Nutrient Content and Decomposition of Phragmites Communis Trin. and Typha Angustifolia L.,
W79-03759 2I

Cultural Eutrophicaton of Long Lake, Washington,
W79-03777 5C

Carbon Flow in Four Lake Ecosystems: A Structural Approach,
W79-03815 5C

Algae in Culture and Nature,
W79-03843 5C

Comparison of Bioassay Procedures for Growth-Limiting Nutrients in the Laurentian Great Lakes,
W79-03850 5A

Nutrient Kinetics of Freshwater Planktonic Algae Using Batch and Semicontinuous Methods,
W79-03857 5A

Selenium as a Micronutrient for the Dinoflagellate Peridinium Cinctum Fa. Westii,
W79-03859 5C

Algal Tests Used to Study the Chemical Factors Regulating the Growth of Planktonic Algae in the Helsinki Sea Area,
W79-03889 5A

The Algal Growth Potential of an Inland Saline and Eutrophic Lake,
W79-03891 5C

Changes in Succession Rate in a Natural Phytoplankton Community Following Nutrient Enrichment,
W79-03894 5C

Balance of Organic Matter in the Ecosystem of the Rybinskiy Reservoir,
W79-03918 5C

The Selenastrum Capricornutum Printz Algal Assay Bottle Test Experimental Design, Application, and Data Interpretation Protocol,
W79-03996 5A

OAHU
Meteorological Analysis of an Oahu Flood,
W79-03580 2E

OCEANS
Sea Surface Temperature Observations by a Radiation Thermometer Aboard an Ice Reconnaissance Aircraft,
W79-03616 7B

OFFSHORE DRILLING
Fresh Groundwater Beneath Continental Shelf: Findings of Atlantic Continental-Margin Drilling Program,
W79-03562 1A

Origin of Fresh Ground Water Beneath the U.S. Atlantic Continental Shelf,
W79-03589 1A

OGALLALA AQUIFER (TEXAS)
Analytical Study of the Ogallala Aquifer in Lynn and Graza Counties, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W79-03818 4B

OHIO
Phenology, Distribution, and Survival of Atriplex Triangularis Willd. In an Ohio Salt Pan,
W79-03749 2I

OHIO RIVER
Power Development and Water Allocation in Ohio River Basin,
W79-03537 4A

Fish-Population Studies in the Ohio River,
W79-03921 5C

OHIO RIVER BASIN
Ohio River Basin Energy Study, Orbes Phase I. Interim Findings,
W79-03971 6G

OIL FIELDS
Aliphatic Acid Anions in Oil-Field Waters--Implications for Origin of Natural Gas,
W79-03558 1A

OIL PETROLEUM
Effects of Oil on Aquatic Birds,
W79-03837 5C

OIL POLLUTION
Disappearance of Aromatic Hydrocarbons and Organic Sulfur Compounds from Fish Flesh Reared in Crude Oil Suspension,
W79-03654 5C

Arrangement for Disposing of Fluid Floating Matter,
W79-03793 5G

Oil Slick Removal and Recovery System,
W79-03796 5G

Proceedings of the 1977 Oil Spill Response Workshop,
W79-03830 5G

Status and Future Trends in Oil Spills and Implications for the U.S. Fish and Wildlife Service,
W79-03831 5G

National Oil and Hazardous Substances Pollution Contingency Pland and Federal Responsibilities,
W79-03832 5G

Fate of Oil in the Sea,
W79-03835 5C

Assessing the Biological Impact of Oil Spills: A New role for EPA Biologists,
W79-03836 5C

Containment and Recovery Techniques for Spilled Oil in the Marine Environment,
W79-03838 5G

OIL RECOVERY
Containment and Recovery Techniques for Spilled Oil in the Marine Environment,
W79-03838 5G

OIL SHALES
Environmental Effects of Oil Shale Mining and Processing, Part 1: Fishes of Piceance Creek, Colorado, Prior to Oil Shale Processing,
W79-03974 5C

Sampling and Analysis Research Program at the Paraho Shale Oil Demonstration,
W79-03980 5A

OIL SLICKS
Oil Slick Removal and Recovery System,
W79-03796 5G

OIL SPILLS
Chemical Additives for Improvement of Oil Spill Control,
W79-03575 5G

Proceedings of the 1977 Oil Spill Response Workshop,
W79-03830 5G

Status and Future Trends in Oil Spills and Implications for the U.S. Fish and Wildlife Service,
W79-03831 5G

California's Response to Pollution Incidents,
W79-03833 5G

Industry Views and Responsibilities in Oil Spill Wildlife Operations,
W79-03834 5G

Fate of Oil in the Sea,
W79-03835 5C

Assessing the Biological Impact of Oil Spills: A New role for EPA Biologists,
W79-03836 5C

Containment and Recovery Techniques for Spilled Oil in the Marine Environment,
W79-03838 5G

Chemical Oil Dispersing Agents and Their Feasibility for Use,
W79-03839 5G

Restoration of Oil-Contaminated Shorelines,
W79-03840 5G

OIL WASTES
A Case Study of Hazardous Wastes in Class I Landfills,
W79-03984 5B

ON-SITE INVESTIGATIONS
Determination of Specific Breakup Energy and Contact Pressures Produced by the Impact of a Solid Against Ice,
W79-03632 2C

Apparatus and Method for Sampling Water for Fish Larvae and Other Trophic Levels,
W79-03781 7B

Chemical Characterization of the Gaseous and Liquid Environments of Subsurface Drain Systems,
W79-03801 2K

Actual Evapotranspiration Over a Summer Period in the 'Hupsel Catchment',
W79-03813 2D

Experimental Application of Various Systems of Biological Indication of Water Pollution,
W79-03939 5A

ON-SITE TESTS
Water System Virus Detection,
W79-03784 5A

OPTICAL PROPERTIES
Ice Pressure on Separately Standing Supports in Laboratory and Natural Tests,
W79-03607 2C

Effect of Sea Ice Salinity on Optical Extinction at Wavelength 6,328 A,
W79-03608 2C

Optical Characteristics of Some Varieties of Natural Ice,
W79-03609 2C

Instruments for Analyzing Spectral Reflection of Liquid Water in the Wavelength Range from 1 to 50 Microns,
W79-03610 7B

OPTIMIZATION
Optimal Sequencing for a Multipurpose Water Supply System,
W79-03518 4A

Land Use Allocation Model for Flood Control,
W79-03534 4A

On the Theory and Modeling of Dynamic Programming with Applications in Reservoir Operation,
W79-03671 4A

ORANGE COUNTY (CALIF)
Management of Saline Water,
W79-03774 6B

OREGON
Motorboat Use on the Wild Rogue River: An Investigation of Use Between Watson Creek and Blossom Bar,
W79-03695 5B

ORGANIC ACIDS
Aliphatic Acid Anions in Oil-Field Waters--Implications for Origin of Natural Gas,
W79-03558 1A

ORGANIC CHEMICALS
A Rapid Method for Estimating Log P for Organic Chemicals,
W79-03978 5A

ORGANIC COMPOUNDS
On the Relation of Organotrophy of Marine Unicellular Algae to the Density of Their Experimental Populations and Individual Weights of Cells,
W79-03509 5C

ORGANIC MATTER
Balance of Organic Matter in the Ecosystem of the Rybinskiy Reservoir,
W79-03918 5C

The Importance of Trophic Bonds in the Bacterial Destruction of Organic Matter,
W79-03919 5C

ORGANIC WASTES
Overview of the Fresh Pack Food Industries,
W79-03970 5B

Assessment of Potential Toxic Releases from Leather Industry Dyeing Operations,
W79-03972 5B

ORGANOPHOSPHORUS PESTICIDES
Accumulation of the Organophosphate Blackfly Larvicide Abate (Temephos) in Sarotherodon Mossambicus, with Reference to the Larvicidal Control of Simulium Damnosum,
W79-03647 5C

ORGANOTROPHY
On the Relation of Organotrophy of Marine Unicellular Algae to the Density of Their Experimental Populations and Individual Weights of Cells,
W79-03509 5C

ORIGIN OF NATURAL GAS
Aliphatic Acid Anions in Oil-Field Waters--Implications for Origin of Natural Gas,
W79-03558 1A

OSCILLATORIA AGARDHII
Growth of Oscillatoria Agardhii in Chemostat Culture. 2. Dependence of Growth Constants on Temperature,
W79-03852 5A

Light-Limited Cultures of the Blue-Green Alga Oscillatoria Agardhii,
W79-03858 5C

N-Uptake and Pigmentation of N-Limited Chemostat Cultures and Natural Populations of Oscillatoria Agardhii,
W79-03868 5C

Competition of the Green Alga Scenedesmus and the Blue-Green Alga Oscillatoria,
W79-03884 5C

OSLOFJORD (NORWAY)
Growth Experiments with Marine Plankton Algae: The Role of 'Water Quality' in Species Succession,
W79-03888 5C

OUTER CONTINENTAL SHELF
Impact of Nearshore Development on Open Coastal Resources,
W79-03829 5C

Proceedings of the 1977 Oil Spill Response Workshop,
W79-03830 5G

Status and Future Trends in Oil Spills and Implications for the U.S. Fish and Wildlife Service,
W79-03831 5G

National Oil and Hazardous Substances Pollution Contingency Pland and Federal Responsibilities,

Chemical Oil Dispersing Agents and Their Feasibility for Use,
W79-03839 5G

Restoration of Oil-Contaminated Shorelines,
W79-03840 5G

OUTFALL SEWERS
The Effect of Wastewater Treatment on Methanogenesis in a Marine Outfall,
W79-03636 5C

OXIDATION
Water Supply System,
W79-03789 5F

OXIDATION LAGOONS
Insect Pest Problems Associated with Wastewater Oxidation Lakes in Michigan,
W79-03684 5G

Note on the Fertility Value of Oxidation Pond Effluent for Groundnut (Arachis Hypogaea L.),
W79-03696 5D

OXIDATION LAKES
Insect Pest Problems Associated with Wastewater Oxidation Lakes in Michigan,
W79-03684 5G

OXYGEN
Monthly Oxygen and Carbon Budgets of the New York Bight Apex,
W79-03555 5B

Routine Oxygen Consumption of Mugil Cephalus, Liza Dumerili and I. Richardsoni at Different Temperatures and Salinities,
W79-03652 5C

OXYGEN REQUIREMENTS
Routine Oxygen Consumption of Mugil Cephalus, Liza Dumerili and I. Richardsoni at Different Temperatures and Salinities,
W79-03652 5C

OYSTERS
Monitoring the Condition of Flowing Waters by Biological Oranisms,
W79-03913 5A

OZONE-DEPLETION
Results of Research Related to Stratospheric Ozone Protection. Report to Congress,
W79-03977 5A

PAICE
237Pu Experiments with the Plaice Pleuronectes Platessa,
W79-03901 5C

PALAEMONETES
Survival, Duration of Larval Stages, and Size of Post-Larvae of Grass Shrimp, Palaemonetes Pugio, Reared from Kepone Contaminated and Uncontaminated Populations in Chesapeake Bay.
W79-03642 5C

PALEOCLIMATOLOGY
Early Deglaciation of the Labrador Shelf.
W79-03814 2C

PANAMA
Mortality and Initial Propagule Size in Mangrove Seedlings in Panama.
W79-03740 2I

PARAMETRIC UNCERTAINTY
Simulation Procedures for Box-Jenkins Models.
W79-03523 2E

PARAQUAT
Paraquat Sorption as a Function of Particle Size in Natural Sediments.
W79-03595 5B

PARASITISM
Physiological Responses of Mytilus Edulis L. to Parasitic Infestation by Mytilicola Intestinalis.
W79-03545 5C

PATENTS
Colloid Free Precipitation of Heavy Metal Sulfides.
W79-03778 5G

System and Method for Cooling Hot Water from Industrial Plant Cooling Use.
W79-03779 5G

Method and Means for Irrigating Soil and Growing Plants Having Varying Water Requirements.
W79-03780 3F

Apparatus and Method for Sampling Water for Fish Larvae and Other Trophic Levels.
W79-03781 7B

Apparatus for Desalinating Water.
W79-03782 3A

Electrochemical Water Desalination Process.
W79-03783 3A

Water System Virus Detection.
W79-03784 5A

Water Collection Indicator Device.
W79-03785 3F

Mobile Agricultural Irrigation Apparatus.
W79-03786 3F

Fluid Spray Head and Method Adapted to Spray Specific Pattern.
W79-03787 3F

System for Pollution Suppression.
W79-03788 5D

Water Supply System.
W79-03789 5F

Method of Disposing of a Ferrous-Ion Containing Acidic Aqueous Waste for Forming Polycrystalline Iron Compound Particles.
W79-03790 5D

Method for Slime Control.
W79-03791 5G

Treatment of Waste Liquid and Apparatus Therefor and a Fertilizer Composition Obtained Thereby.
W79-03792 5D

Arrangement for Disposing of Fluid Floating Matter.
W79-03793 5G

Center Pivot Irrigation Apparatus.
W79-03794 3F

Method and Apparatus for Controlling a Water Turbine.
W79-03795 8C

Oil Slick Removal and Recovery System.
W79-03796 5G

Combined Filter and Incinerator.
W79-03797 5D

PATH OF POLLUTANTS
Factors Affecting Atrazine Adsorption, Degradation and Mobility in Soil.
W79-03670 5B

PATHOGENIC BACTERIA
Biological and Ecological Studies on the Interaction of Bdellovibrio and Enterobacteriaceae.
W79-03691 5C

PATHOLOGY
Histopathological Effects Induced in Mytilus Edulis by Mytilicola Intestinalis and the Histochemistry of the Copepod Intestinal Cells.
W79-03544 5C

PATHWAYS
The Mechanisms of Carbon Dioxide Fixation in Phytoplankton.
W79-03860 5C

PAYMENT
Environmental Quality, The Market, and Public Finance.
W79-03768 6G

PEAT
An Investigation of the Biotic Factors Determining the Rates of Plant Decomposition on Blanket Bog.
W79-03760 2I

PENNSYLVANIA
Methodologies of Examining Pollution from Urban Runoff.
W79-03689 5B

Effects of Spary Irrigation of Municipal Wastewater on the Physical Properties of the Soil.
W79-03766 5C

PENOBSCOT RIVER (ME)
Benthic Macroinvertebrate Communities of the Penobscot River, Maine, with Special Reference to Their Role as Water Quality Indicators.
W79-03669 5A

PENTACHLOROPHENOL
Fate and Impact of Pentachlorophenol in a Freshwater Ecosystem.
W79-03999 5B

PERFORMANCE
Simulation of Advanced Wastewater Treatment Systems.
W79-03524 5D

PERIDINIUM CINCTUM FA WESTII
Selenium as a Micronutrient for the Dinoflagellate Peridinium Cinctum Fa Westii.
W79-03859 5C

PERIYAR RIVER (SO INDIA)
Pollution Profile of A River.
W79-03641 5B

PERMAFROST
Soil - Moisutre - Temperature for Alaskan Lowland.
W79-03582 2C

Magnetic Survey of Ice Wedges.
W79-03613 2C

Low Frequency Polarization of Ice in Frozen Coarse-Dispersion Formations.
W79-03614 2C

PERSONNEL
Environmental Specialists in Water Agencies.
W79-03531 6G

PERTURBATION EXPERIMENTS
Phosphorus Kinetics--Algal Growth Relationships in Batch Cultures.
W79-03861 5C

PESTICIDE REMOVAL
State-of-the-Art Report: Pesticide Disposal Research.
W79-03986 5E

PESTICIDE RESIDUES
Accumulation of the Organophosphate Blackfly Larvicide Abate (Temephos) in Sarotherodon Mossambicus, with Reference to the Larvicida Control of Simulium Damnosum.
W79-03647 5C

Influence of the Polychlorinated Biphenyl Preparation Aroclor 1242 on Color Changes of the Fiddler Crab Uca Pugilator.
W79-03656 5C

The Effect of High 2, 4-D Concentrations o Degradation and Carbon Dioxide Evolution i Soils.
W79-03678 5

Coho Salmon (Oncorhynchus Kisutch) and Her ring Gulls (Larus Argentatus as Indicators o Organochlorine Contamination in Lake Ontario
W79-03895 5A

PESTICIDE TOXICITY
The Effect of Endrin on the Histopathologica Changes in the Liver of Channa Punctatus.
W79-03503 5C

Effects of the Insect Grwoth Regulator Dimili (TH 6040) on Larval Development of two E tuarine Crabs.
W79-03644 5

Registration of Pesticides: Considerations i Conducting Aquatic Toxicity Tests.
W79-03922 5A

PESTICIDES
A Conceptual Model for the Movement of Pesticides Through the Environment: A Contributio of the EPA Alternative Chemicals Program
W79-03757 5

Mirex in the Sediments of Lake Ontario.
W79-03810 5

Registration of Pesticides: Considerations Conducting Aquatic Toxicity Tests.
W79-03922 5

PHAEODACTYLUM TRICORNUTUM
The Mechanisms of Carbon Dioxide Fixation Phytoplankton.
W79-03860 5

PHARMACEUTICAL INDUSTRY
Pharmaceutical Industry Hazardous Was Generation, Treatment, and Disposal.
W79-03579 5

PHEASANTS
Combating Pheasant Losses in the Columbia Basin - Where do we Go from Here,
W79-03686 6B

Pheasant Enhancement Potentials in Irrigated Agriculture: A Case Study of the Columbia Basin,
W79-03687 6B

PHENOL
Fate and Impact of Pentachlorophenol in a Freshwater Ecosystem,
W79-03999 5B

PHENOLOGY
Phenology, Distribution, and Survival of Atriplex Triangularis Willd. In an Ohio Salt Pan,
W79-03749 2I

PHENOLS
The Selection and Limitations of Phenol as a Reference Toxicant to Detect Differences in Sensitivity Among Groups of Rainbow Trout (Salmo Gairdneri),
W79-03655 5A

Experimental Research on Phenol Intoxication of Aquatic Organisms and Destruction of Phenol in Model Communities,
W79-03923 5C

PHOSPHATES
Phosphate Incorporation by Daphnids and Channel Catfish in Phosphate-Rich Environments,
W79-03585 5C

Determination of Phosphate by Cathodic Stripping Chronopotentiometry at a Copper Electrode,
W79-03769 5A

PHOSPHORUS
The Blue-Green Algae Keep Coming,
W79-03510 5C

Retardation of Sediment Phosphorus Release by Fly Ash Application,
W79-03560 5C

Effect of Soil Moisture Content Upon Adsorption and Movement of Phosphorus from Leachates of Domestic Waste Disposal Systems,
W79-03683 5B

Note on the Fertility Value of Oxidation Pond Effluent for Groundnut (Arachis Hypogaea L.),
W79-03696 5D

Solubilization of Biologically Available Phosphorus by Autoclaving Selenastrum,
W79-03848 5A

Phosphorus Kinetics--Algal Growth Relationships in Batch Cultures,
W79-03861 5C

Nitrogen and Phosphorus Storage and Utilization in Blue-Green Algae,
W79-03865 5C

Phosphorus Availability in Three Streams During Storm Events: Chemical Analysis Vs. Algal Assay,
W79-03882 5A

Modeling of N- and P- Uptake by Scenedesmus Acutus, with Regard to Tertiary Treatment of Domestic Waste Water,
W79-03885 5C

Relationship Between Algal Phosphorus Extraction and Water Phosphorus Concentration,
W79-03890 5C

PHOTOSYNTHESIS
Polychlorinated Biphenyl (PCB) Effects on Marine Phytoplankton Photosynthesis and Cell Division,
W79-03650 5C

Phytoplankton Nitrogen Metabolism, Nitrogen Budgets, and Observations on Copper Toxicity: Controlled Ecosystem Pollution Experiment,
W79-03738 5A

The Mechanisms of Carbon Dioxide Fixation in Phytoplankton,
W79-03860 5C

The Variable Chlorophyll-A Fluorescence as a Measure of Photosnythetic Capacity in Algae,
W79-03863 5A

PHOTOSYNTHESIS. *PHOTOPERIODISM
Growth Cycle of a Freshwater Diatom,
W79-03856 5C

PHREATOPHYTES
The Development and Perpetuation of the Permanent Tamarisk Type in the Phreatophyte Zone of the Southwest,
W79-03718 3B

PHYTOPLANKTON
The Blue-Green Algae Keep Coming,
W79-03510 5C

An Experimental Simulation of Changes in Diatom and Flagellate Blooms,
W79-03511 5C

Stirring Influences the Phytoplankton Species Composition Within Enclosed Columns of Coastal Sea Water,
W79-03512 5C

Polychlorinated Biphenyl (PCB) Effects on Marine Phytoplankton Photosynthesis and Cell Division,
W79-03650 5C

Regulation of Copper Availability to Phytoplankton by Macromolecules in Lake Water,
W79-03651 5B

Phytoplankton Nitrogen Metabolism, Nitrogen Budgets, and Observations on Copper Toxicity: Controlled Ecosystem Pollution Experiment,
W79-03738 5A

Symposium: Experimental Use of Algal Cultures in Limnology; Sandefjord, Norway, 26-28 October 1976.
W79-03842 5C

Algae in Culture and Nature,
W79-03843 5C

A Modified Turbidostatic System for Algal Population Studies,
W79-03847 5A

Comparison of Bioassay Procedures for Growth-Limiting Nutrients in the Laurentian Great Lakes,
W79-03850 5A

The Effect of Sewage (Mechanically, Biologically, and Chemically Treated) on Algal Growth,
W79-03854 5C

Nutrient Kinetics of Freshwater Planktonic Algae Using Batch and Semicontinuous Methods,
W79-03857 5A

Light-Limited Cultures of the Blue-Green Alga Oscillatoria Agardhii,
W79-03858 5C

The Mechanisms of Carbon Dioxide Fixation in Phytoplankton,
W79-03860 5C

Phosphorus Kinetics--Algal Growth Relationships in Batch Cultures,
W79-03861 5C

A Mathematical Model for Growth of Phytoplankton,
W79-03862 5C

Effects of River Discharge on the Coastal Phytoplankton Cycle,
W79-03873 5C

Water Chemical Analyses and/or Algal Assay. -- Sewage Effluent and Polluted Lake Water Studies,
W79-03875 5A

The Use of Natural Phytoplankton Populations in Bioassay,
W79-03876 5A

Use of Laboratory Cultures of Selenastrum, Anabaena and the Indigenous Isolate Sphaerocystis to Predict Effects of Nutrient and Zinc Interactions Upon Phytoplankton Growth in Long Lake, Washington,
W79-03877 5C

The Application of Culture Methods in Studies of the Ecology of Small Green Algae,
W79-03878 5A

The Use of Small, Continuous and Multispecies Cultures to Investigate the Ecology of Phytoplankton in a Scottish Sea-Loch,
W79-03879 5C

Algal Tests Used to Study the Chemical Factors Regulating the Growth of Planktonic Algae in the Helsinki Sea Area,
W79-03889 5A

The Role of Nutrient Competition in a Predictive Theory of Phytoplankton Population Dynamics,
W79-03893 5C

Changes in Succession Rate in a Natural Phytoplankton Community Following Nutrient Enrichment,
W79-03894 5C

A Steady-State Phytoplankton Model of Chesapeake Bay,
W79-03899 5C

Polychlorinated Biphenyl (PCB) Uptake by Marine Phytoplankton,
W79-03903 5C

The Role of Algae in the Pollution of Reservoirs and Problems of Controlling Their Numbers,
W79-03914 5C

Distribution of Phytoplankton in Illinois Lakes,
W79-03989 5C

Distribution of Phytoplankton in North Carolina Lakes,
W79-03990 5C

Distribution of Phytoplankton in Indiana Lakes,
W79-03991 5C

PICEANCE BASIN (COLORADO)
Environmental Effects of Oil Shale Mining and Processing, Part II: The Aquatic Macroinvertebrates of the Piceance Basin, Colorado, Prior to Oil Shale Processing,
W79-03975 5C

PICEANCE CREEK (COLORADO)
Environmental Effects of Oil Shale Mining and Processing. Part 1: Fishes of Piceance Creek, Colorado, Prior to Oil Shale Processing.
W79-03974 5C

PIGMENTS
N-Uptake and Pigmentation of N-Limited Chemostat Cultures and Natural Populations of Oscillatoria Agardhii.
W79-03868 5C

PILOT PLANTS
Design, Construction, and Field Evaluation Tests of an 10,000 GPD Skid-Mounted Alumina-Lime-Soda Pilot Plant.
W79-03765 3A

PINK SALMON
Vascular Effects of Acetylcholine, Catecholamines and Detergents on Isolated Perfused Gills of Pink Salmon, Oncorhynchus Gorbuscha, Coho Salmon, O. Kisutch and Chum Salmon, O. Keta.
W79-03646 5C

PLANKTON
Structural and Functional Characteristics of Seston as Indices of Water Pollution.
W79-03940 5A

PLANNING
Continuous Simulation of Nonpoint Pollution.
W79-03515 5B

Water-Resource Systems Planning.
W79-03528 6B

Urban Runoff Control Master Planning.
W79-03532 6B

Power Development and Water Allocation in Ohio River Basin.
W79-03537 4A

A Study of Interested and Active Parties Concerned with Water Resource Management in Washington State: Implications for a Management Systems Model.
W79-03693 6B

NWS's Flash Flood Warning and Disaster Preparedness Programs.
W79-03816 6F

Proceedings of the 1977 Oil Spill Response Workshop.
W79-03830 5G

Status and Future Trends in Oil Spills and Implications for the U.S. Fish and Wildlife Service.
W79-03831 5G

National Oil and Hazardous Substances Pollution Contingency Pland and Federal Responsibilities.
W79-03832 5G

California's Response to Pollution Incidents.
W79-03833 5G

PLANT GROWTH
The Effect of Competition and Salinity on the Growth of a Salt Marsh Plant Species.
W79-03634 2I

Phytoplankton Nitrogen Metabolism, Nitrogen Budgets, and Observations on Copper Toxicity: Controlled Ecosystem Pollution Experiment.
W79-03738 5A

Comparative Growth and Foliar Element Concentrations of Larix Laricina Over a Range of Wetland Types in Minnesota.
W79-03739 2I

Seasonal Ionic Fluctuations in a Phragmites Communis Community.
W79-03747 2I

Algae in Culture and Nature.
W79-03843 5C

On the Kinetics of Light-Limited Growth of Scenedesmus Protuberans Fritsch and Ecological Implications.
W79-03855 5C

Light-Limited Cultures of the Blue-Green Alga Oscillatoria Agardhii.
W79-03858 5C

Selenium as a Micronutrient for the Dinoflagellate Peridinium Cinctum Fa. Westii.
W79-03859 5C

Phosphorus Kinetics--Algal Growth Relationships in Batch Cultures.
W79-03861 5C

A Mathematical Model for Growth of Phytoplankton.
W79-03862 5C

Results of Research Related to Stratospheric Ozone Protection, Report to Congress.
W79-03977 5A

PLANT MORPHOLOGY
Variations in the Shallow Water Form of Potamogeton Richardsonii Induced by Some Environmental Factors.
W79-03554 5C

Pleomorphism of Scenedesmus Quadricauda (Turp.) Breb. (Chlorophyceae) in Synchronized Cultures.
W79-03864 5C

PLANT PHYSIOLOGY
Physiological Indicators of Nutrient Deficiency in Algae.
W79-03846 5A

PLEOMORPHISM
Pleomorphism of Scenedesmus Quadricauda (Turp.) Breb. (Chlorophyceae) in Synchronized Cultures.
W79-03864 5C

PLUTONIUM
237Pu Experiments with the Thornback Ray Raja Clavata.
W79-03649 5A

237Pu Experiments with the Plaice Pleuronectes Platessa.
W79-03901 5C

POISONS
Anatoxins from Clones of Anabaena Flos-Aquae Isolated from Lakes of Western Canada.
W79-03870 5C

POLAROGRAPHIC ANALYSIS
Polarographic Determination of Lead Hydroxide Formation Constants at Low Ionic Strength.
W79-03592 5A

POLLUTANT IDENTIFICATION
Evaluation of Vinyl Chloride Emissions in the Long Beach Area, California.
W79-03577 5B

Determination of Phosphate by Cathodic Stripping Chronopotentiometry at a Copper Electrode.
W79-03769 5A

Voltammetric Determination of Trace Quantities of Nitrate in an Anion Exchange Membrane Isolated Cell.
W79-03771 5A

Sampling and Analysis Research Program at the Paraho Shale Oil Demonstration.
W79-03980 5A

Arsenic Determination by the Silver Diethyldithiocarbamate Method and the Elimination of Metal Ion Interference.
W79-03982 5A

A Case Study of Hazardous Wastes in Class I Landfills.
W79-03984 5E

POLLUTANT IDENTIFICTION
A Rapid Method for Estimating Log P for Organic Chemicals.
W79-03978 5A

POLLUTANTS
Testing of Substances for their Toxicity Threshold: Model Organisms Microcystic (Diplocystis Aeruginosa and Scenedesmus Quadricauda.
W79-03869 5C

Sorption and Concentration of Taxic Mineral by Mass Cultures of Chlorococcales.
W79-03892 5C

Inorganic Species in Water: Ecological Significance and Analytical Needs, a Literature Review.
W79-03992 5C

POLLUTION ABATEMENT
Containment and Recovery Techniques for Spilled Oil in the Marine Environment.
W79-03838 5G

Overview of Nitrogen in Irrigated Agriculture
W79-03959 5C

Pollution Control Guidelines for Coal Refuse Piles and Slurry Ponds.
W79-03968 5G

Source Assessment: Open Mining of Coal, State of the Art.
W79-03969 5G

POLLUTION TAXES (CHARGES)
Environmental Quality, The Market, and Public Finance.
W79-03768 6C

POLYCHAETES
Polychlorinated Biphenyls: Accumulation from Contaminated Sediments and Water by the Polychaete Nereis Diversicolor.
W79-03904 5C

POLYCHLORINATED BIPHENYL
Size Dependent Model of Hazardous Substance in Aquatic Food Chain.
W79-03997 5C

POLYCHLORINATED BIPHENYLS
Polychlorinated Biphenyl (PCB) Effects on Marine Phytoplankton Photosynthesis and Cell Division.
W79-03650 5C

Influence of the Polychlorinated Biphenyl Preparation Aroclor 1242 on Color Changes of the Fiddler Crab Uca Pugilator.
W79-03656 5C

Effects of Polychlorinated Biphenyl Compounds and Proposed PCB-Replacement Products on Embryo-Larval Stages of Fish and Amphibia.
W79-03763 5C

Polychlorinated Biphenyl (PCB) Uptake by Marine Phytoplankton.
W79-03903 5C

Polychlorinated Biphenyls: Accumulation from Contaminated Sediments and Water by the Polychaete Nereis Diversicolor,
W79-03904 5C

PCBs: Their Environmental Significance and Distribution in Rhode Island,
W79-03964 5B

Polychlorinated Biphenyls in Precipitation in the Lake Michigan Basin,
W79-03993 5C

PONDING
Derivation of Equations for Variable Rainfall Infiltration,
W79-03681 2G

PONDS
Annual Metabolism of a Temporary Pond Ecosystem,
W79-03750 2I

Evaluation of a Prototype Automated Pond Water Treatment Unit,
W79-03764 5F

POPULATION DYNAMICS
The Role of Nutrient Competition in a Predictive Theory of Phytoplankton Population Dynamics,
W79-03893 5C

POROUS MEDIA
A Mathematical Treatment of Infiltration from a Line Source into an Inclined Porous Medium,
W79-03800 2G

POTABLE WATER
The Multielemental Analysis of Drinking Water Using Proton-Induced X-Ray Emission (PIXE),
W79-03981 5A

POTHOLES
Ecological Distribution of Breeding Waterfowl Populations in North Dakota.
W79-03732 2I

Vegetation Changes in Shallow Marsh Wetlands Under Improving Moisture Regime,
W79-03735 2I

POWER SYSTEM OPERATION
Heat Storage Wells: Key to Large-Scale Cogeneration.
W79-03586 4B

POWERPLANTS
Wet/Dry Cooling Systems for Fossil-Fueled Power Plants: Water Conservation and Plume Abatement,
W79-03547 5G

Design and Analysis of Aquatic Monitoring Programs at Nuclear Power Plants,
W79-03566 5G

Analysis of Different Types of Dry-Wet Cooling Towers,
W79-03661 8C

PRECIPITATION
Polychlorinated Biphenyls in Precipitation in the Lake Michigan Basin,
W79-03993 5C

PRIMARY PRODUCTION
Enhancement of Sockeye Salmon (Oncorhynchus Nerka) by Lake Fertilization in Great Central Lake: Summary Report,
W79-03658 5C

PRIMARY PRODUCTIVITY
Ecosystem and Macrophyte Primary Production of the Fort River, Massachusetts,
W79-03748 2I

Primary Production in the Freshwater Marsh Ecosystem of Troy Meadows, New Jersey,
W79-03758 2H

The Variable Chlorophyll-A Fluorescence as a Measure of Photosnythetic Capacity in Algae,
W79-03863 5A

PROBIT LINES
Mortality Patterns in Trout (Salmo Trutta and S. Gairdneri) Exposed to an Anionic Detergent in Relation to Concentration and Mechanisms of Toxic Action,
W79-03637 5C

PRODUCTIVITY
Seasonal Changes in the Standing Crop of Two Montane Sedges,
W79-03734 2I

Primary Production and Life History of Carex Lacustris,
W79-03737 2I

Annual Metabolism of a Temporary Pond Ecosystem,
W79-03750 2I

Production, Nutrient Content and Decomposition of Phragmites Communis Trin. and Typha Angustifolia L.,
W79-03759 2I

PROJECTS
Simulation of Advanced Wastewater Treatment Systems,
W79-03524 5D

Methods for Evaluating Non-Market Impacts in Policy Decisions with Special Reference to Water Resources Development Projects,
W79-03525 6B

Recent Developments in the McClellan-Kerr Arkansas River Navigation System Area.
W79-03526 4A

PROPANOLOL
Vascular Effects of Acetylcholine, Catecholamines and Detergents on Isolated Perfused Gills of Pink Salmon, Oncorhynchus Gorbuscha, Coho Salmon, O. Kisutch and Chum Salmon, O. Keta,
W79-03646 5C

PROTEIN
Collagen and Hydroxyproline in Toxicological Studies with Fishes,
W79-03934 5C

PROTEINS
Evaluation of Protein and Nutritive Fiber Content of Cultivated Russian - Thistle,
W79-03587 3F

PROTOTYPE TESTS
Sampling and Analysis Research Program at the Paraho Shale Oil Demonstration,
W79-03980 5A

PROTOZOA
Effect of Hexachlorobenzene (HCB) on the Activity of Some Enzymes from Tetrahymena Pyriformis,
W79-03502 5C

The Importance of Trophic Bonds in the Bacterial Destruction of Organic Matter,
W79-03919 5C

PSEUDOCALANUS
The Importance of the Time Factor in the Response of Zooplankton to Varying Concentrations of Naturally Occurring Particulate Matter,
W79-03902 5C

PSEUDOMONAS
Isolation of a Mercuric Chloride-Tolerant Bacterium and Uptake of Mercury by the Bacterium.
W79-03501 5C

PUBLIC HEALTH
Geologic Pollution Problems of Lake Superior,
W79-03938 5B

Human Population Exposures to Mirex and Kepone,
W79-04000 5C

PUBLIC PARTICIPATION
Urban Water Resources Policy Alternatives: A Sociological Analysis of Differential Perspectives,
W79-03660 6B

Public Participation in 208 Water Quality Planning: A Case Study of Triangle J Council of Government, North Carolina,
W79-03666 5G

PUBLIC SECTORS
Recent Developments in the McClellan-Kerr Arkansas River Navigation System Area.
W79-03526 4A

PUBLIC UTILITIES
Ohio River Basin Energy Study, Orbes Phase I: Interim Findings,
W79-03971 6G

PUBLICATIONS
Handbook for Hydrogeologists, Volume I, (Spravochnoe Rukovodstvo Gidrogeologa).
W79-03798 4B

PUERTO
An Economic Analysis of Pricing Residential Water Supplies in Puerto Rico,
W79-03694 6B

PULP WASTES
Color Removal from Kraft Pulping Effluent by Lime Addition.
W79-03573 5D

Effects of Different Process Wastes and Main Sewer Effluents from Pulp Mills on the Growth and Production of Ankiistrodesmus Falcatus Var. Acicularis (Chlorophyta),
W79-03874 5C

PUMPING
Characteristics of Pumping Tests Conducted in Heterogeneous Clastic Sediments of the Edmonton Area, Alberta,
W79-03823 4B

PUT-IN-BAY (OH)
The Decline of Lake Plants,
W79-03508 5C

RADAR
Propagation of Radio Waves in Glaciers,
W79-03600 2C

Measurement of Reflected Signals During Radar Sounding in a Large Range of Angles,
W79-03603 2C

Remote Measurement of the Thickness of Sea Ice by Radar Methods,
W79-03605 7B

Coastal Ice Dynamics According to Slar Observations,
W79-03615 7B

RADIATION
Variations in the Shallow Water Form of Potamogeton Richardsonii Induced by Some Environmental Factors,
W79-03554 5C

Radiation and Energy Balance of a Trickle-Irrigated Lemon Grove.
W79-03828 3F

RADIO WAVES
FM Radar Signals Reflected From Ice Surfaces, and the Possibilities for Modeling Them.
W79-03598 2C

Effect of Ice Structure on Its Radiation Characteristics in the SHF Range.
W79-03599 2C

Propagation of Radio Waves in Glaciers.
W79-03600 2C

Radio Sounding of Sea Ice.
W79-03601 2C

Emissivity o Ice, Terrestrial, and Sea Surfaces Modeled by Stratified Heterogeneous Structures.
W79-03602 2C

Depolarization of Reflected Radio Signals.
W79-03604 7B

RADIOISOTOPES
Pollution Profile of A River.
W79-03641 5B

237Pu Experiments with the Thornback Ray Raja Clavata.
W79-03649 5A

237Pu Experiments with the Plaice Pleuronectes Platessa.
W79-03901 5C

RAINBOW TROUT
Carbonic Anhydrase (Acetazolamide-Sensitive Esterase) Activity in the Blood, Gill and Kidney of the Thermally Acclimated Rainbow Trout, Salmo Gairdneri.
W79-03559 5C

Mortality Patterns in Trout (Salmo Trutta and S. Gairdneri) Exposed to an Anionic Detergent in Relation to Concentration and Mechanisms of Toxic Action.
W79-03637 5C

The Effect of Copper, Hardness and pH on the Growth of Rainbow Trout, Salmo Gairdneri.
W79-03648 5C

The Selection and Limitations of Phenol as a Reference Toxicant to Detect Differences in Sensitivity Among Groups of Rainbow Trout (Salmo Gairdneri).
W79-03655 5A

Cadmium Uptake by Rainbow Trout, Salmo Gairdneri Eggs and Alevins.
W79-03657 5C

RAINDROP IMPACT
Some Effects of Soil Surface Cover on Infiltration.
W79-03676 2G

RAINFALL
Polychlorinated Biphenyls in Precipitation in the Lake Michigan Basin.
W79-03993 5C

RAINFALL INTENSITY
Methodologies of Examining Pollution from Urban Runoff.
W79-03689 5B

RANGE GRASSES
Measuring Symbiotic Nitrogen Fixation in Rangeland Plots of Trifolium Subterraneum L. and Bromus Mollis L.,
W79-03552 7B

RANGE MANAGEMENT
Measuring Symbiotic Nitrogen Fixation in Rangeland Plots of Trifolium Subterraneum L. and Bromus Mollis L.,
W79-03552 7B

RAYS
237Pu Experiments with the Thornback Ray Raja Clavata,
W79-03649 5A

RE-SOLUTION OF SALTS
Cyclic Wetting and Drying of the Soil Zone as an Influence on the Chemistry of Ground Water in Arid Terrains.
W79-03584 2K

RECLAMATION
Pollution Control Guidelines for Coal Refuse Piles and Slurry Ponds
W79-03968 5G

RECREATION
Water Resource Standards for Second Home and Recreational Land Development.
W79-03675 5G

Motorboat Use on the Wild Rogue River: An Investigation of Use Between Watson Creek and Blossom Bar.
W79-03695 5B

Some Effects of a Campground on Breeding Birds in Arizona.
W79-03724 4C

RECYCLING
Utilizing Solid Wastes for Building Materials.
W79-03570 5E

REFERENCE TOXICANTS
The Selection and Limitations of Phenol as a Reference Toxicant to Detect Differences in Sensitivity Among Groups of Rainbow Trout (Salmo Gairdneri).
W79-03655 5A

REFLECTANCE
Instruments for Analyzing Spectral Reflection of Liquid Water in the Wavelength Range from 1 to 50 Microns.
W79-03610 7B

REGIONAL DEVELOPMENT
Interregional Impacts of Alternative Water Policies for Irrigation in the Western United States: A Quantitative Assessment.
W79-03664 6B

REGIONAL ECONOMICS
Interregional Impacts of Alternative Water Policies for Irrigation in the Western United States: A Quantitative Assessment,
W79-03664 6B

REGRESSION ANALYSIS
Some Effects of Soil Surface Cover on Infiltration.
W79-03676 2G

REGULATION
A Brief History of Water Pollution Research in United States.
W79-03908 5G

REMOTE SENSING
Information Requirements for Improving Hydropower.
W79-03542 8C

Aquatic and Terrestrial Surveys in the Vicinity of Power Plants using Remote Sensing.
W79-03567 5A

Physical Methods of Studying Ice and Snow.
W79-03596 2C

Radiophysical Methods for Analyzing Ice and Snow.
W79-03597 2C

FM Radar Signals Reflected From Ice Surfaces and the Possibilities for Modeling Them,
W79-03598 2C

Effect of Ice Structure on Its Radiation Characteristics in the SHF Range,
W79-03599 2C

Propagation of Radio Waves in Glaciers,
W79-03600 2C

Emissivity o Ice, Terrestrial, and Sea Surface Modeled by Stratified Heterogeneous Structures,
W79-03602 2C

Measurement of Reflected Signals During Rada Sounding in a Large Range of Angles,
W79-03603 2C

Remote Measurement of the Thickness of Se Ice by Radar Methods,
W79-03605 7B

Low Frequency Polarization of Ice in Froze Coarse-Dispersion Formations,
W79-03614 2C

Coastal Ice Dynamics According to Slar Obse vations,
W79-03615 7C

Sea Surface Temperature Observations by a R diation Thermometer Aboard an Ice Reconnai sance Aircraft,
W79-03616 7C

Use of Acoustic Methods to Analyze Snow an Ice,
W79-03617 7C

Analysis of Glacier Dynamics Using a Las Deformograph,
W79-03621 2C

A Method for Measuring High Moisture R serves in Snow Cover Using Cosmic Radiatio
W79-03626 7C

A Radio Hydroacoustic Method for Analyzin Moderate-Range Characteristics of Sea Ice D namics,
W79-03633 7C

The LANDSAT Lake Eutrophication Stud
W79-03682 7C

Map Unit Composition Assessment Using Drai age Classes Defined by LANDSAT Data,
W79-03802 7C

REPRODUCTION
Ultrastructural Alterations in the Eggshe Gland Epithelium of the Mallard Duck aft Chronic Exposure to DDT,
W79-03506 5C

Mortality and Initial Propagule Size in Ma grove Seedlings in Panama,
W79-03740

RESEACH
Reseach on Minnesota Water Problems.
W79-03674 9B

RESEARCH PRIORITIES
Riparian Research Needs.
W79-03714 6B

Executive Summary of Desalting Plans a Progress, an Evaluation of the State-of-the-A and Future Research and Development Requi ments.
W79-03775 3A

Desalting Plans and Progress, An Evaluation of the State-of-the-Art and Future Research and Development Requirements,
W79-03776 3A

RESERVOIR DESIGN
Simulation Procedures for Box-Jenkins Models,
W79-03523 2E

RESERVOIR OPERATIONS
On the Theory and Modeling of Dynamic Programming with Applications in Reservoir Operation,
W79-03671 4A

RESERVOIR STAGES
On the Theory and Modeling of Dynamic Programming with Applications in Reservoir Operation,
W79-03671 4A

RESERVOIRS
Balance of Organic Matter in the Ecosystem of the Rybinskiy Reservoir,
W79-03918 5C

RESOURCE AVAILABILITY
Sand and Gravel Offshore in the Greater New York Metropolitan Area: What Kind and How Much,
W79-03963 2L

RESOURCES DEVELOPMENT
Impact of Nearshore Development on Open Coastal Resources,
W79-03829 5C

RETENTION BASINS
Urban Water Resources Policy Alternatives: A Sociological Analysis of Differential Perspectives,
W79-03660 6B

RETURN FLOW
Monitoring Water for Nitrogen Losses from Croplands,
W79-03950 5G

Economic Impacts of Controlling Nitrogen Concentration and Other Water Quality Determinants in the Yakima River Basin,
W79-03956 5G

REVERSE OSMOSIS
New Polymeric Membranes Containing Phosphonate Ester Groups for Water Desalination,
W79-03688 3A

Design, Construction, and Field Evaluation Tests of an 10,000 GPD Skid-Mounted Alumina-Lime-Soda Pilot Plant,
W79-03765 3A

REVIEWS
Microbiology-Waterborne Outbreaks, (Literature Review),
W79-03773 5C

Executive Summary of Desalting Plans and Progress, an Evaluation of the State-of-the-Art and Future Research and Development Requirements,
W79-03775 3A

W79-03880 5A

ROAD CONSTRUCTION
The Effects of Motorway Construction on an Urban Stream,
W79-03639 5C

ROBUSTNESS
Water-Resource Systems Planning,
W79-03528 6B

ROCKY MOUNTAIN REGION
Seasonal Changes in the Standing Crop of Two Montane Sedges.
W79-03734 2I

RODENTS
Population Fluctuations in Nocturnal Rodents in the Lower Colorado River Valley.
W79-03725 2I

Terrestrial Mammals of the Riparian Corridor in Big Bend National Park.
W79-03728 2I

ROOT CONTROL
Economic Analysis, Root Control, and Backwater Flow Control as Related to Infiltration/Inflow Control.
W79-03841 5G

ROOT DEVELOPMENT
Quantitative Estimation of Living Wheat-Root Lengths in Soil Cores.
W79-03514 3F

Root Growth Along Plexiglas Surfaces by Sugarcane Under Different Soil Salinity Conditions.
W79-03546 3C

ROOT SYSTEMS
Root Production and Root Turnover in a Wet Tundra Ecosystem, Barrow, Alaska.
W79-03736 2I

ROOT ZONE
Use of Mathematical Relationships to Describe the Behavior of Nitrogen in the Crop Root Zone.
W79-03952 3F

ROOTED AQUATIC PLANTS
The Life History of Shoots of Carex Lacustris.
W79-03733 2I

Seasonal Changes in the Standing Crop of Two Montane Sedges.
W79-03734 2I

Vegetation Changes in Shallow Marsh Wetlands Under Improving Moisture Regime.
W79-03735 2I

Root Production and Root Turnover in a Wet Tundra Ecosystem, Barrow, Alaska.
W79-03736 2I

Primary Production and Life History of Carex Lacustris.
W79-03737 2I

Phenology, Distribution, and Survival of Atriplex Triangularis Willd. In an Ohio Salt Pan.
W79-03749 2I

Annual Metabolism of a Temporary Pond Ecosystem.
W79-03750 2I

ROOTS
Economic Analysis, Root Control, and Backwater Flow Control as Related to Infiltration/Inflow Control.
W79-03841 5G

ROSWELL BASIN (N MEX)
Recharge and Groundwater Conditions in the Western Region of the Roswell Basin.
W79-03663 2F

RUSSIAN-THISTLE
Evaluation of Protein and Nutritive Fiber Content of Cultivated Russian - Thistle.
W79-03587 3F

RYBINSKIA RESERVOIR (USSR)
Balance of Organic Matter in the Ecosystem of the Rybinskiy Reservoir.
W79-03918 5C

SALICYLANILIDE
Simulation of Potential Pollutant-Caused Changes in the Ecosystem, Resulting from the Sensitivity of Aquatic Organisms to Toxicants.
W79-03920 5C

SALINE LAKES
The Algal Growth Potential of an Inland Saline and Eutrophic Lake.
W79-03891 5C

SALINE SOILS
Root Growth Along Plexiglas Surfaces by Sugarcane Under Different Soil Salinity Conditions.
W79-03546 3C

Birds and Mammals of Salt Marshes and Salt Steppes in Southern Slovakia (CSSR).
W79-03744 2L

SALINE WATER
Management of Saline Water.
W79-03774 6B

SALINITY
Delaware River Basin Water Resources Management.
W79-03538 6B

Root Growth Along Plexiglas Surfaces by Sugarcane Under Different Soil Salinity Conditions.
W79-03546 3C

Ice Pressure on Separately Standing Supports in Laboratory and Natural Tests.
W79-03607 2C

Effect of Sea Ice Salinity on Optical Extinction at Wavelength 6.328 A.
W79-03608 2C

The Effect of Competition and Salinity on the Growth of a Salt Marsh Plant Species.
W79-03634 2I

Routine Oxygen Consumption of Mugil Cephalus, Liza Dumerili and L. Richardsoni at Different Temperatures and Salinities.
W79-03652 5C

Management of Saline Water.
W79-03774 6B

SALMON
Application of Decision Theory to Salmon Management.
W79-03522 6A

SALMONIDS
Influences of Riparian Vegetation on Aquatic Ecosystems with Particular Reference to Salmonid Fishes and their Food Supply.
W79-03720 2I

SALT MARSHES
The Effect of Competition and Salinity on the Growth of a Salt Marsh Plant Species.
W79-03634 2I

A Geochemical Study of a Marsh Environment.
W79-03743 2K

Birds and Mammals of Salt Marshes and Salt Steppes in Southern Slovakia (CSSR).
W79-03744 2L

Phenology, Distribution, and Survival of Atriplex Triangularis Willd. In an Ohio Salt Pan.
W79-03749 2I

The Effects of Ditching a Salt Marsh on Colony and Nest Site Selection by Herring Gulls (Larus Argentatus).
W79-03752 6G

Geographical Variation in British Saltmarsh Vegetation.
W79-03761 2

SALTCEDAR
The Development and Perpetuation of the Permanent Tamarisk Type in the Phreatophyte Zone of the Southwest.
W79-03718 3

SALTON SEA (CALIF)
Management of Saline Water.
W79-03774 6

SALTS
Solute Travel-Time Estimates for Tile-Drained Fields: III. Removal of a Geothermal Brine Spill from Oil by Leaching.
W79-03961 2G

SAMPLING
Apparatus and Method for Sampling Water for Fish Larvae and Other Trophic Levels.
W79-03781 7

Scenario for an Ongoing Chlorophyll a Surveillance Plan on Lake Ontario for Non-Intensive Sampling Years.
W79-03808 5

Sampling of Groundwaters for Chemical Analysis.
W79-03822 2

Composition and Properties of Lipid Surface Films Produced by Chlorella Pyrenoidosa.
W79-03866 5

Sampling and Analysis Research Program at the Paraho Shale Oil Demonstration.
W79-03980 5

Proceedings of the Second Workshop on Sampling Geothermal Effluents
W79-03987 5

SAMPLING FREQUENCIES
Evaluating the Sampling Frequencies of Water Quality Monitoring Networks.
W79-03976 5

SAN FRANCISCO BAY AREA
Engineering Solutions to Bay Area Drought Conditions.
W79-03536 4

SAN JOAQUIN VALLEY (CALIF)
An Economic Methodology for Evaluating 'Best Management Practices' in the San Joaquin Valley of California.
W79-03958 5

SAND TANKS
Evaporation of Water from Sand, 6. The Influence of the Water Table on Diurnal Variation
W79-03960 2

SANDS
Investigation of the Feasibility of Dewatering Buried Valley Sands to Aid Sewer-Tunnel Excavations, Edmonton, Alberta.
W79-03824 8

Evaporation of Water from Sand, 6. The Influence of the Water Table on Diurnal Variation
W79-03960 2

Sand and Gravel Offshore in the Greater New York Metropolitan Area: What Kind and How Much.
W79-03963 6

SANTA ANA RIVER (CALIF)
A Case Study-Nitrates in the Upper Santa Ana River Basin in Relation to Groundwater Pollution,
W79-03955 5B

SANTA MARIA VALLEY (CALIF)
Nitrogen Balances for the Santa Maria Valley,
W79-03957 5G

SANTEE RIVER (SC)
Lower Santee River Environmental Quality Study; An Assessment of Selected Biological and Physical Parameters.
W79-03513 5B

SAROTHERODON
Accumulation of the Organophosphate Blackfly Larvicide Abate (Temephos) in Sarotherodon Mossambicus, with Reference to the Larvicidal Control of Simulium Damnosum,
W79-03647 5C

SATELLITES (ARTIFICIAL)
Map Unit Composition Assessment Using Drainage Classes Defined by LANDSAT Data,
W79-03802 7B

SCENEDESMUS
Role of Inorganic Carbon Availability in the Formation of Nuisance Blooms of Blue-Green Algae,
W79-03762 5C

SCENEDESMUS ACUTUS VAR. ALTERNANS
Modeling of N- and P- Uptake by Scenedesmus Acutus, with Regard to Tertiary Treatment of Domestic Waste Water,
W79-03885 5C

Sorption and Concentration of Taxic Minerals by Mass Cultures of Chlorococcales,
W79-03892 5C

SCENEDESMUS PROTUBERANS
On the Kinetics of Light-Limited Growth of Scenedesmus Protuberans Fritsch and Ecological Implications,
W79-03855 5C

Competition of the Green Alga Scenedesmus and the Blue-Green Alga Oscillatoria,
W79-03884 5C

SCENEDESMUS QUADRICAUDA
Pleomorphism of Scenedesmus Quadricauda (Turp.) Breb. (Chlorophyceae) in Synchronized Cultures,
W79-03864 5C

Testing of Substances for their Toxicity Threshold: Model Organisms Microcystic (Diplocystis) Aeruginosa and Scenedesmus Quadricauda,
W79-03869 5C

SCOUR
Scour and Fill Patterns in Pool-Rapid Rivers,
W79-03668 2J

SEA ICE
Physical Methods of Studying Ice and Snow,
W79-03596 2C

Radio Sounding of Sea Ice,
W79-03601 2C

Remote Measurement of the Thickness of Sea Ice by Radar Methods,
W79-03605 7B

Ice Pressure on Separately Standing Supports in Laboratory and Natural Tests,
W79-03607 2C

Effect of Sea Ice Salinity on Optical Extinction at Wavelength 6,328 A,
W79-03608 2C

Coastal Ice Dynamics According to Slar Observations,
W79-03615 7B

Sea Surface Temperature Observations by a Radiation Thermometer Aboard an Ice Reconnaissance Aircraft,
W79-03616 7B

Attenuation and Scattering of Sound Waves by Sea Ice,
W79-03618 7B

A Radio Hydroacoustic Method for Analyzing Moderate-Range Characteristics of Sea Ice Dynamics,
W79-03633 7B

SEA WATER
Biological Problems with the Use of Sea Water for Cooling,
W79-03543 5C

SEASONAL
Seasonal Changes in the Standing Crop of Two Montane Sedges,
W79-03734 2I

Annual Metabolism of a Temporary Pond Ecosystem,
W79-03750 2I

Growth Experiments with Marine Plankton Algae: The Role of 'Water Quality' in Species Succession,
W79-03888 5C

SEDGES
The Life History of Shoots of Carex Lacustris,
W79-03733 2I

SEDIMENT CONTROL
The Effects of Motorway Construction on an Urban Stream,
W79-03639 5C

SEDIMENT DEPOSITION
Adsorption and Desorption in Mine Drainages,
W79-03673 5B

SEDIMENT TRANSPORT
Scour and Fill Patterns in Pool-Rapid Rivers,
W79-03668 2J

SEDIMENTS
Paraquat Sorption as a Function of Particle Size in Natural Sediments,
W79-03595 5B

Mirex in the Sediments of Lake Ontario,
W79-03810 5B

Effects of Sediments on the Development of Macrocystis Pyrifera Gametophytes,
W79-03905 5C

SEEDLING EMERGENCE
The Effect of Stabilized, Hydrophobic Aggregate Layer Properties on Soil Water Regime and Seedling Emergence,
W79-03803 2G

SEISMIC STUDIES
Seismic and Tilt Meter Methods for Analyzing Ice Cover,
W79-03620 7B

SEISMIC WAVES
Seismic and Tilt Meter Methods for Analyzing Ice Cover,
W79-03620 7B

SELENASTRUM
The Selenastrum Capricornutum Printz Algal Assay Bottle Test Experimental Design, Application, and Data Interpretation Protocol,
W79-03996 5A

SELENASTRUM CAPRICORNUTUM
Solubilization of Biologically Available Phosphorus by Autoclaving Selenastrum,
W79-03848 5A

The Use of Selenastrum Capricornutum Batch Cultures in Toxicity Studies,
W79-03872 5A

SELENIUM
Selenium as a Micronutrient for the Dinoflagellate Peridinium Cinctum Fa. Westii,
W79-03859 5C

SELF PURIFICATION
Permissible Pollution Levels of Water Bodies,
W79-03907 5G

SEQUENCING
Optimal Sequencing for a Multipurpose Water Supply System,
W79-03518 4A

SESTON
Structural and Functional Characteristics of Seston as Indices of Water Pollution,
W79-03940 5A

SEWAGE DISPOSAL
The Effects of Spary Irrigation on a Mixed Forest Ecosystem,
W79-03679 5C

The Algal Growth Potential of an Inland Saline and Eutrophic Lake,
W79-03891 5C

SEWAGE EFFLUENTS
Effects of Spary Irrigation of Municipal Wastewater on the Physical Properties of the Soil,
W79-03766 5C

SEWAGE LAGOONS
Liners for Sanitary Landfills and Chemical and Hazardous Waste Disposal Sites,
W79-03985 5G

SEWAGE OCEAN OUTFALL
Survey of Benthic Coral Reef Ecosystems, Fish Populations, and Micromollusks in the Vicinity of the Wai'anae Sewage Ocean Outfall, O'Ahu, Hawaii -- Summer 1975,
W79-03591 5E

SEWAGE SLUDGE
Measurement of the Engineering Properties of Municipal Incinerator Residues and Consideration of Leachate Characteristics,
W79-03685 5B

The Behavior of Nutrient Elements Added to a Forest Soil with Sewage Sludge,
W79-03805 5B

SEWAGE TREATMENT
The Effect of Wastewater Treatment on Methanogenesis in a Marine Outfall,
W79-03636 5C

Note on the Fertility Value of Oxidation Pond Effluent for Groundnut (Arachis Hypogaea L.),
W79-03696 5D

System for Pollution Suppression,
W79-03788 5D

The Effect of Sewage (Mechanically, Biologically, and Chemically Treated) on Algal Growth,
W79-03854 5C

SEWERAGE
Allocational Inefficiency of Benefit/Cost Applied to Water and Sewerage Supply: Interac-

tions Between Time-Series and Cross-Sectional Models.
W79-03520 6B

Issues in Waste Water Treatment Facility Location.
W79-03594 5G

SEWERS
Economic Analysis, Root Control, and Backwater Flow Control as Related to Infiltration/Inflow Control.
W79-03841 5G

SHORES
Restoration of Oil-Contaminated Shorelines.
W79-03840 5G

SHORT-TERM OPERATION
Water Resources Control Through Systems Analysis.
W79-03519 4A

SHRIMP
Survival, Duration of Larval Stages, and Size of Post-Larvae of Grass Shrimp, Palaemonetes Pugio, Reared from Kepone Contaminated and Uncontaminated Populations in Chesapeake Bay.
W79-03642 5C

SHRUBS
The Development and Perpetuation of the Permanent Tamarisk Type in the Phreatophyte Zone of the Southwest.
W79-03718 3B

SILICA
Design, Construction, and Field Evaluation Tests of an 10,000 GPD Skid-Mounted Alumina-Lime-Soda Pilot Plant.
W79-03765 3A

SILICATES
The Role of Nutrient Competition in a Predictive Theory of Phytoplankton Population Dynamics.
W79-03893 5C

SIMILARITY INDICES
Survey of Benthic Coral Reef Ecosystems, Fish Populations, and Micromollusks in the Vicinity of the Wai'anae Sewage Ocean Outfall, O'Ahu, Hawaii -- Summer 1975.
W79-03591 5E

SIMULATED RAINFALL
Some Effects of Soil Surface Cover on Infiltration.
W79-03676 2G

Displacement of Soil Water by Simulated Rainfall.
W79-03799 2G

SIMULATION ANALYSIS
Continuous Simulation of Nonpoint Pollution.
W79-03515 5B

Simulation Procedures for Box-Jenkins Models.
W79-03523 2E

Simulation of Advanced Wastewater Treatment Systems.
W79-03524 5D

Simulation of Potential Pollutant-Caused Changes in the Ecosystem, Resulting from the Sensitivity of Aquatic Organisms to Toxicants.
W79-03920 5C

SIZE
Mortality and Initial Propagule Size in Mangrove Seedlings in Panama.
W79-03740 2I

SKEENA RIVER FISHERY (BC)
Application of Decision Theory to Salmon Management.
W79-03522 6A

SKEIN RIVER (NORWAY)
Effects of River Discharge on the Coastal Phytoplankton Cycle.
W79-03873 5C

SKELETONEMA
Polychlorinated Biphenyl (PCB) Effects on Marine Phytoplankton Photosynthesis and Cell Division.
W79-03650 5C

SKELETONEMA COSTATUM
The Mechanisms of Carbon Dioxide Fixation in Phytoplankton.
W79-03860 5C

SKIN CANCER
Results of Research Related to Stratospheric Ozone Protection, Report to Congress.
W79-03977 5A

SNOW
Physical Methods of Studying Ice and Snow.
W79-03596 2C

Measurement of Reflected Signals During Radar Sounding in a Large Range of Angles.
W79-03603 2C

Use of Acoustic Methods to Analyze Snow and Ice.
W79-03617 7B

Mechanical Properties of Snow as a Construction Material.
W79-03624 8G

Methods for Measuring the Strength Characteristics of Natural and Processed Snow.
W79-03627 8G

SNOW COVER
Arctic Snow Cover.
W79-03625 2C

A Method for Measuring High Moisture Reserves in Snow Cover Using Cosmic Radiation.
W79-03626 7B

SOCIAL PARTICIPATION
Public Process Portion of Impacts Analysis.
W79-03539 6G

Urban Water Resources Policy Alternatives: A Sociological Analysis of Differential Perspectives.
W79-03660 6B

SOCIO-ECONOMIC ASPECTS
Climate, Climatic Change, and Water Supply.
W79-03527 2B

SOCKEYE SALMON
Vascular Effects of Acetylcholine, Catecholamines and Detergents on Isolated Perfused Gills of Pink Salmon, Oncorhynchus Gorbuscha, Coho Salmon, O. Kisutch and Chum Salmon, O Keta.
W79-03646 5C

Enhancement of Sockeye Salmon (Oncorhynchus Nerka) by Lake Fertilization in Great Central Lake: Summary Report.
W79-03658 5C

SODIUM ALUMINOSILICATE
Application of Algal Assays in the Environmental Evaluation of New Detergent Materials.
W79-03887 5A

SODIUM CHLORIDE
The Problem of Studying Charge Generation on the Phase Interface of 0.001 Molar Sodium Chloride Solution Undergoing Directed Freezing.
W79-03611 2C

SODIUM CITRATE
Application of Algal Assays in the Environmental Evaluation of New Detergent Materials.
W79-03887 5A

SODIUM LAURYL SULPHATE
Mortality Patterns in Trout (Salmo Trutta and S. Gairdneri) Exposed to an Anionic Detergent in Relation to Concentration and Mechanisms of Toxic Action.
W79-03637 5C

SOIL AMENDMENTS
Factors Influencing the Volatilization of Mercury from Soil.
W79-03988 5B

SOIL CHEMISTRY
Investigation of Landfill Leachate Pollutant Attenuation by Soils.
W79-03983 5B

Factors Influencing the Volatilization of Mercury from Soil.
W79-03988 5B

SOIL CLASSIFICATION
Map Unit Composition Assessment Using Drainage Classes Defined by LANDSAT Data.
W79-03802 7B

SOIL CORES
Quantitative Estimation of Living Wheat-Roo
Lengths in Soil Cores.
W79-03514 3I

SOIL EROSION
Transport of a Noncohesive Sandy Mixture i
Rainfall and Runoff Experiments.
W79-03804 2

SOIL MICROORGANISMS
Microbial Populations in Flooded Swamp Soi
of South Carolina.
W79-03742 2C

Factors Influencing the Volatilization of Me
cury from Soil.
W79-03988 5

SOIL MOISTURE
Soil - Moisutre - Temperature for Alaskan Lo
land.
W79-03582 2

Effect of Soil Moisture Content Upon Adsor
tion and Movement of Phosphorus from Le
chates of Domestic Waste Disposal System
W79-03683 5

Displacement of Soil Water by Simulated Rai
fall.
W79-03799 2

The Effect of Stabilized, Hydrophobic Aggr
gate Layer Properties on Soil Water Regime a
Seedling Emergence.
W79-03803 2

Comparison of Calculated and Experimenta
Determined Values of Soil-Water Diffusivi
W79-03812 2

SOIL PERMEABILITY
Investigation of Landfill Leachate Pollutant A
tenuation by Soils.
W79-03983 5

SOIL PHYSICAL PROPERTIES
Factors Influencing the Volatilization of Mercury from Soil,
W79-03988 5B

SOIL SURFACE COVER
Some Effects of Soil Surface Cover on Infiltration,
W79-03676 2G

SOIL TEMPERATURE
Soil - Moisutre - Temperature for Alaskan Lowland,
W79-03582 2C

SOIL TYPES
Soil - Moisutre - Temperature for Alaskan Lowland,
W79-03582 2C

An Investigation of the Biotic Factors Determining the Rates of Plant Decomposition on Blanket Bog,
W79-03760 2I

SOIL WATER
Relative Evaluation of Water Stress Indicators for Soybeans,
W79-03521 3F

Cyclic Wetting and Drying of the Soil Zone as an Influence on the Chemistry of Ground Water in Arid Terrains,
W79-03584 2K

Gravimetric VS. Volumetric Determination of Water Storage in Vertically Unstable Tillage Layers,
W79-03806 7B

SOIL WATER MOVEMENT
Displacement of Soil Water by Simulated Rainfall,
W79-03799 2G

Comparison of Calculated and Experimentally Determined Values of Soil-Water Diffusivity,
W79-03812 2G

SOIL-WATER-PLANT RELATIONSHIPS
Comparative Growth and Foliar Element Concentrations of Larix Laricina Over a Range of Wetland Types in Minnesota,
W79-03739 2I

SOILS
Volatile Losses of Nitrogen from Soil,
W79-03947 3F

SOLAR RADIATION
Apparatus for Desalinating Water,
W79-03782 3A

SOLID WASTES
Measurement of the Engineering Properties of Municipal Incinerator Residues and Consideration of Leachate Characteristics,
W79-03685 5B

SOLUBLE REACTIVE PHOSPHORUS
Relationship Between Algal Phosphorus Extraction and Water Phosphorus Concentration,
W79-03890 5C

SORPTION
Paraquat Sorption as a Function of Particle Size in Natural Sediments,
W79-03595 5B

Sorption and Concentration of Taxic Minerals by Mass Cultures of Chlorococcales,
W79-03892 5C

SOUND WAVES
Attenuation and Scattering of Sound Waves by Sea Ice,
W79-03618 7B

One Method for Measuring Sound Attenuation in Natural Ice,
W79-03619 7B

SOUNDING
Radio Sounding of Sea Ice,
W79-03601 2C

SOUTH AMERICA
Habitat Selection by Waterfowl of Argentine Isla Grande,
W79-03756 2I

SOUTH CAROLINA
User-Oriented Conceptual Modeling in the Ecological Characterization of the Sea Islands and Coastal Plain of South Carolina and Georgia,
W79-03701 6A

Microbial Populations in Flooded Swamp Soils of South Carolina,
W79-03742 2G

SOUTHEAST U.S.
Fresh Groundwater Beneath Continental Shelf: Findings of Atlantic Continental-Margin Drilling Program,
W79-03562 1A

Origin of Fresh Ground Water Beneath the U.S. Atlantic Continental Shelf,
W79-03589 1A

SOUTHWEST U.S.
Classification of Riparian Habitat in the Southwest,
W79-03704 2I

Management Alternatives for Riparian Habitat in the Southwest,
W79-03712 6G

Riparian Research Needs,
W79-03714 6G

The Development and Perpetuation of the Permanent Tamarisk Type in the Phreatophyte Zone of the Southwest,
W79-03718 3B

The Importance of Riparian Habitat to Migrating Birds,
W79-03722 2I

Terrestrial Mammals of the Riparian Corridor in Big Bend National Park,
W79-03728 2I

SOUTHWEST US
Southwestern Riparian Communities: Their Biotic Importance and Management in Arizona,
W79-03727 6G

SOYBEANS
Relative Evaluation of Water Stress Indicators for Soybeans,
W79-03521 3F

SPATIAL DISTRIBUTION
Statistical Evaluation of the Spatial Distribution of the Principal Ice Cover Parameters,
W79-03628 2C

SPAWNING
Application of Decision Theory to Salmon Management,
W79-03522 6A

SPECIES COMPOSITION
Stirring Influences the Phytoplankton Species Composition Within Enclosed Columns of Coastal Sea Water,
W79-03512 5C

SPECIES DIVERSITY
Characteristics of the Moscow River Water Quality According to Hydrobiological Indices,
W79-03909 5A

Fish-Population Studies in the Ohio River,
W79-03921 5C

History of Changes in Fish Species of the Great Lakes,
W79-03924 5C

SPECTROSCOPY
X-Ray Analysis of Airborne Asbestos, Design and Construction of a Prototype Asbestos Analyzer,
W79-03967 5A

SPILLS
A Feasibility Study of Response Techniques for Discharges of Hazardous Chemicals that Disperse Through the Water Column,
W79-03578 5D

SPORES
Effects of Sediments on the Development of Macrocystis Pyrifera Gametophytes,
W79-03905 5C

SPRAY IRRIGATION
Effects of Spary Irrigation of Municipal Wastewater on the Physical Properties of the Soil,
W79-03766 5C

SPRINKLER IRRIGATION
Fluid Spray Head and Method Adapted to Spray Specific Pattern,
W79-03787 3F

Center Pivot Irrigation Apparatus,
W79-03794 3F

STANDARDS
Principles and Methods of Biological Establishment of the Norms of Chemical Substances and Evaluation of the Level of Pollution in Water-Bodies,
W79-03929 5G

A Research System for Developing Fisheries Standards for Water Quality, Considering the Peculiarities of Transferring Experimental Data to Natural Water Bodies,
W79-03933 5G

STANDING CROP
The Relationship Between Standing Crop in Sedge Meadows and Summer Temperature,
W79-03754 2I

STANDING CROPS
Seasonal Changes in the Standing Crop of Two Montane Sedges,
W79-03734 2I

Primary Production and Life History of Carex Lacustris,
W79-03737 2I

STATE GOVERNMENTS
Public Participation in 208 Water Quality Planning: A Case Study of Triangle J Council of Government, North Carolina,
W79-03666 5G

STATISTICS
Statistical Evaluation of the Spatial Distribution of the Principal Ice Cover Parameters,
W79-03628 2C

STEADY-STATE EXPERIMENTS
Phosphorus Kinetics--Algal Growth Relationships in Batch Cultures,
W79-03861 5C

STOCK WATER
Anatoxins from Clones of Anabaena Flos-Aquae Isolated from Lakes of Western Canada.
W79-03870 5C

STORAGE
Least-Cost Design of Urban-Drainage Networks.
W79-03533 5D

The Culture Collection Point of View.
W79-03845 5A

Nitrogen and Phosphorus Storage and Utilization in Blue-Green Algae.
W79-03865 5C

STORM RUNOFF
Methodologies of Examining Pollution from Urban Runoff.
W79-03689 5B

Phosphorus Availability in Three Streams During Storm Events: Chemical Analysis Vs. Algal Assay.
W79-03882 5A

STORM SEWERS
Least-Cost Design of Urban-Drainage Networks.
W79-03533 5D

STREAMFLOW
'Instream Fow'-Applicability of Existing Methodologies for Alaskan Waters.
W79-03517 4A

STREAMFLOW FORECASTING
Information Requirements for Improving Hydropower.
W79-03542 8C

STREAMS
Urea Fertilization of Natural Forest: Effects on Water Quality.
W79-03507 5C

The Effects of Motorway Construction on an Urban Stream.
W79-03639 5C

Phosphorus Availability in Three Streams During Storm Events: Chemical Analysis Vs. Algal Assay.
W79-03882 5A

Environmental Effects of Oil Shale Mining and Processing, Part II: The Aquatic Macroinvertebrates of the Piceance Basin, Colorado, Prior to Oil Shale Processing.
W79-03975 5C

STRENGTH
Methods for Measuring the Strength Characteristics of Natural and Processed Snow.
W79-03627 8G

Field Analyses of Physiocomechanical Properties of Ice Cover.
W79-03631 2C

Determination of Specific Breakup Energy and Contact Pressures Produced by the Impact of a Solid Against Ice.
W79-03632 2C

STRIP MINES
Source Assessment: Open Mining of Coal, State of the Art.
W79-03969 5G

SUBLETHAL EFFECTS
Effects of Oil on Aquatic Birds.
W79-03837 5C

SUBMERGED PLANTS
Vegetation Changes in Shallow Marsh Wetlands Under Improving Moisture Regime.
W79-03735 2I

Summary of Available Information on Chesapeake Bay Submerged Vegetation.
W79-03746 2I

SUBSURFACE DRAINS
Chemical Characterization of the Gaseous and Liquid Environments of Subsurface Drain Systems.
W79-03801 2K

SUBSURFACE IRRIGATION
Method and Means for Irrigating Soil and Growing Plants Having Varying Water Requirements.
W79-03780 3F

SUBSURFACE WATERS
Aliphatic Acid Anions in Oil-Field Waters--Implications for Origin of Natural Gas.
W79-03558 1A

SUCCESSION
An Experimental Simulation of Changes in Diatom and Flagellate Blooms.
W79-03511 5C

Vegetation Changes in Shallow Marsh Wetlands Under Improving Moisture Regime.
W79-03735 2I

Growth Experiments with Marine Plankton Algae: The Role of 'Water Quality' in Species Succession.
W79-03888 5C

Changes in Succession Rate in a Natural Phytoplankton Community Following Nutrient Enrichment.
W79-03894 5C

SUCCESSION RATES
Changes in Succession Rate in a Natural Phytoplankton Community Following Nutrient Enrichment.
W79-03894 5C

SUKHONA RIVER
The Present Situation and the Rate of Self-Purification of the Upper Reaches of the Sukhona River.
W79-03505 5G

SULFATE PULP MILLS
Effects of Different Process Wastes and Main Sewer Effluents from Pulp Mills on the Growth and Production of Ankiistrodesmus Falcatus Var. Acicularis (Chlorophyta).
W79-03874 5C

SULFITE PULP MILLS
Effects of Different Process Wastes and Main Sewer Effluents from Pulp Mills on the Growth and Production of Ankiistrodesmus Falcatus Var. Acicularis (Chlorophyta).
W79-03874 5C

SUNAPEE (NH)
The Effects of Spary Irrigation on a Mixed Forest Ecosystem.
W79-03679 5C

SUNFISHES
Cadmium and Zinc in Muscle of Bluegill (Lepomis Macrochirus) and Largemouth Bass (Micropterus Salmoides) from an Industrially Contaminated Lake.
W79-03640 5A

Mercury Bioconcentration in Fish: Temperature and Concentration Effects.
W79-03643 5B

SURFACE FILMS
Composition and Properties of Lipid Surface Films Produced by Chlorella Pyrenoidosa.
W79-03866 5C

SURFACE-GROUNDWATER RELATIONSHIPS
Recharge and Groundwater Conditions in the Western Region of the Roswell Basin.
W79-03663 2F

SURVEYS
Magnetic Survey of Ice Wedges.
W79-03613 2C

SURVIVAL
Effects of the Insect Grwoth Regulator Dimilin (TH 6040) on Larval Development of two Estuarine Crabs.
W79-03644 5C

SUSPENDED SOLIDS
Transport of a Noncohesive Sandy Mixture in Rainfall and Runoff Experiments.
W79-03804 2J

SUSQUEHANNA RIVER
A Steady-State Phytoplankton Model of Chesapeake Bay.
W79-03899 5C

SWAMPS
Microbial Populations in Flooded Swamp Soils of South Carolina.
W79-03742 2G

Mineral Concentrations in Papyrus in Various African Swamps.
W79-03753 2I

SWEDEN
Dynamics of an Ice Covered Lake with Through-Flow.
W79-03898 2H

SWEET POTATOES
Interregional Impacts of Alternative Water Policies for Irrigation in the Western United States A Quantitative Assessment.
W79-03664 6B

SYCAMORE TREES
Regeneration and Distribution of Sycamore and Cottonwood Trees Along Sonoita Creek, Santa Cruz County, Arizona.
W79-03717 2

SYMPOSIUM
Proceedings of the First and Second USA USSR Symposia on the Effects of Pollutant Upon Aquatic Ecosystems-Volume I: Duluth Minnesota, USA Symposium October 21-23 1975, Volume II: Borok, Jaroslavl Oblast, USSR Symposium June 22-26, 1976.
W79-03906 5C

SYNOPTIC ANALYSIS
Meteorological Analysis of an Oahu Flood.
W79-03580 2B

SYNTHETIC HYDROLOGY
Simulation Procedures for Box-Jenkins Models
W79-03523 2I

SYSTEMS ANALYSIS
Water Resources Control Through System Analysis.
W79-03519 4A

Contributed Papers on Coastal Ecological Characterization Studies. Fourth Biennial International Estuarine Research Federation Conference, October, 1977

☆U.S. GOVERNMENT PRINTING OFFICE: 1979-281-061/20

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.

- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.
